GENERAL

INTRODUCTION

SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of the publication date. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions. These are issued as required.

ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts : components, kits, or chassis. If the part number is not known, include the chassis or kit number of which it is a part, and a sufficient description of the required component for proper identification.

PERSONNEL SAFETY

The following precautions are recommended for personnel safety :

- DO NOT transmit until all RF connectors are verified secure and any open connectors are properly terminated.
- SHUT OFF and DO NOT operate this equipment near electrical blasting caps or in an explosive atmosphere.
- This equipment should be serviced by a qualified technician only.

SERVICE

This radio is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained within.

NOTE

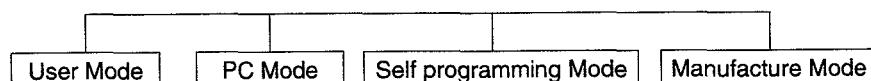

WE CANNOT guarantee oscillator stability when using channel element manufactured by other than KENWOOD or its authorized agents.

Destination	CH number	Frequency	Signalling	RF power output
		Factory default setting

TK-3101

REALIGNMENT

1 Modes

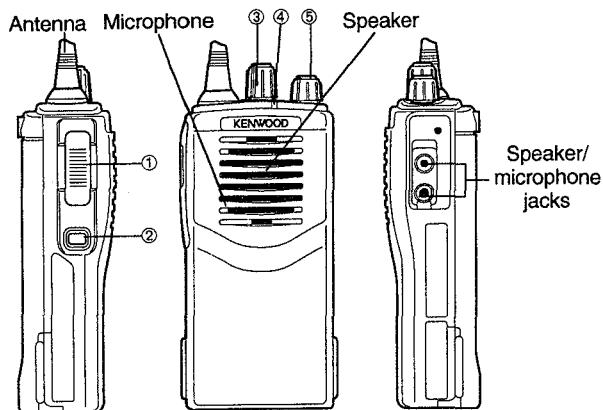

MODE	FUNCTION
User Mode	Use this mode for normal operation.
PC Mode	Use this mode, to make various settings by means of the FPU through the RS-232C port.
Self programming Mode	Use this mode for setting the channel contents.
Manufacture Mode	Use this mode, to realign the various settings through the RS-232C port during manufacture work.

2 How to enter each mode

MODE	FUNCTION
User Mode	Power ON
PC Mode	Connect to the IBM PC compatible machine and controlled by the FPU.
Self programming Mode	[PTT] + [MONI] + Power ON

3 Getting acquainted

① PTT (Push-To-Talk) switch

Press this switch, then speak into the microphone to call a station. Release the switch to receive.

② Monitor key

Press and hold to monitor how busy the current channel is and to monitor signals being received that do not contain the matched QT/DQT code.

③ Channel selector

Rotate to select channels 1 ~ 15.

④ LED indicator

Lights red while transmitting, green while receiving a signal, and orange while in setup mode. Flashes red when the battery voltage is low while transmitting.

⑤ Power switch/ Volume control

Turn clockwise to switch the transceiver ON. Turn counterclockwise until a click sounds, to switch the transceiver OFF. Rotate to adjust the volume level.

TK-3101

REALIGNMENT

PC MODE

Preface

The transceiver is programmed by using a personal computer, programming interface (KPG-22) and programming software (KPG-54D).

The programming software can be used with an IBM PC or compatible. Figure 1 shows the setup of an IBM PC for programming.

Connenction procedure

1. Connect the TK-3101 to the personal computer with the interface cable.
2. When data transmitting from transceiver the red LED goes on.
When data receiving to transceiver the green LED goes on.

Notes:

- The data stored in the personal computer must match Model Name when it is written into EEPROM.
- Do not press the [PTT] key during data transmission or reception.

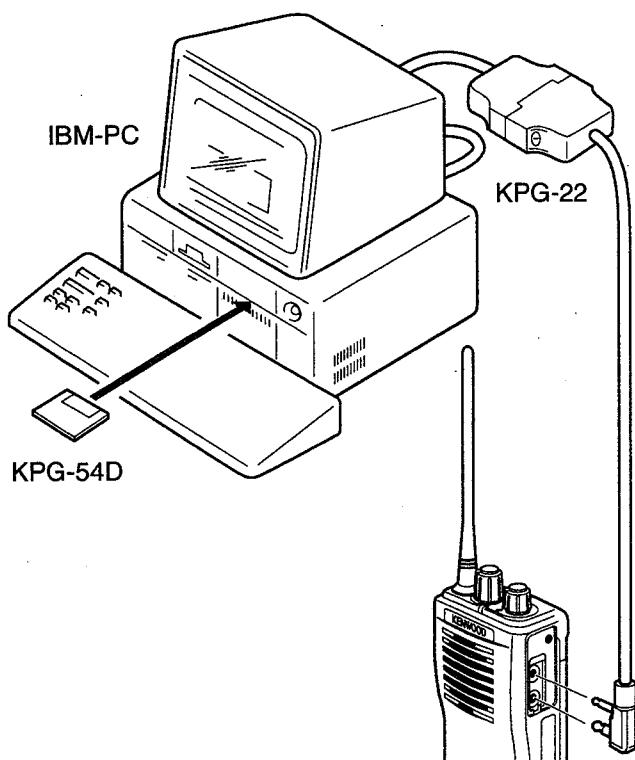

Fig. 1

• KPG-22 description

(P.C programming interface cable: Option)

The KPG-22 is required to interface the TK-3101 to the computer. It has a circuit in its D-subconnector (25-pin) case that converts the RS-232C logic level to the TTL level. The KPG-22 connects the side panel jacks of the TK-3101 to the computers RS-232C serial port.

• Programming software description

The KPG-54D Programming Disk is supplied in 3-1/2" disk format. The Software on this disk allows a user to program TK-3101 radios via Programming interface cable (KPG-22).

• Programming with IBM PC

If data is transferred to the transceiver from an IBM PC with the KPG-54D, the destination data (basic radio information) for each set can be modified. Normally, it is not necessary to modify the destination data because their values are determined automatically when the frequency range (frequency type) is set.

The values should be modified only if necessary.

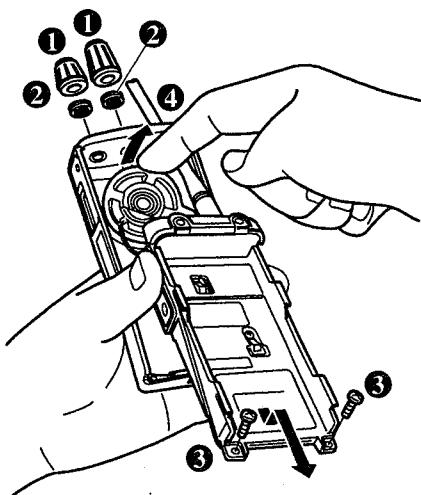

Data can be programmed into the EEPROM in RS-232C format via the SP MIC plug.

In this mode the PTT line operate as TXD and RXD data lines respectively.

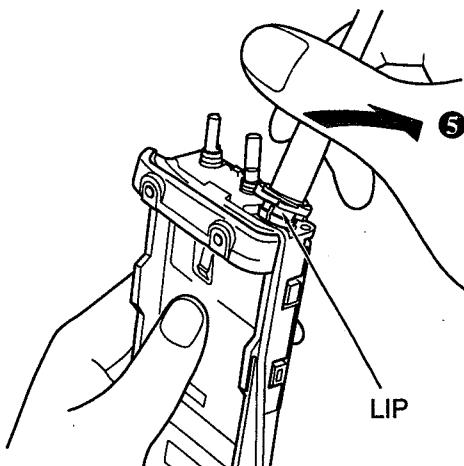

DISASSEMBLY FOR REPAIR

Separating the case assembly from the chassis.

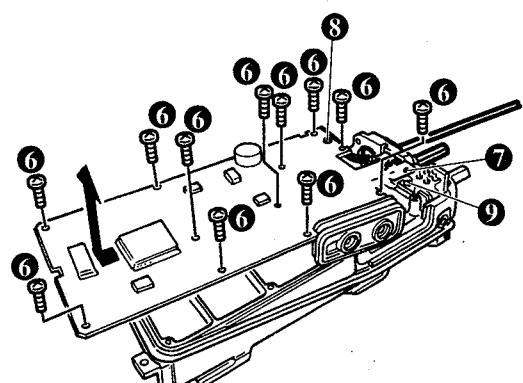

1. Remove the two knobs ① and two round nuts ②.
2. Remove the two screws ③.
3. Firmly hold the front panel, then lift the bottom of the chassis slightly. Carefully pull the chassis out of the case, taking care not to damage the antenna cover or the speaker leads.
To avoid breaking the speaker leads, when the speaker is in slight, lift it away from the case with your finger ④, then completely remove the chassis from the case.

**Removing the antenna cover from the chassis.**

1. Holding the base of the antenna cover, bent it away from the unit as shown by the arrow ⑤ to remove it.

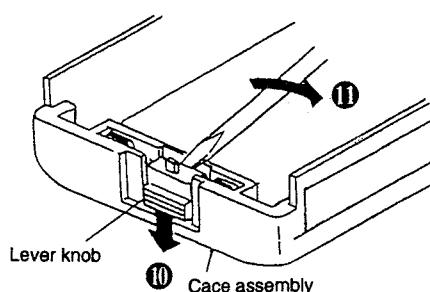

**Separating the chassis from the unit.**

1. Remove the 11screws ⑥ and disconnect the connector ⑦.
2. Remove the solder from the antenna wire ⑧.
3. Remove the screw from the switches ⑨ to remove the switches from the chassis.

**Removing the lever**

1. Raise the lever on the lower case ⑩, insert a small normal screwdriver into the clearance between the case and lever, open the case carefully ⑪ and lift the lever off.

Note : Do not force to separate the case from the lever.

TK-3101

CIRCUIT DESCRIPTION

1. Frequency configuration

The receiver utilizes double conversion. The first IF is 38.85MHz and the second IF is 450kHz. The first local oscillator signal is supplied from the PLL circuit. The PLL circuit in the transmitter generates the necessary frequencies. Fig. 1 shows the frequencies.

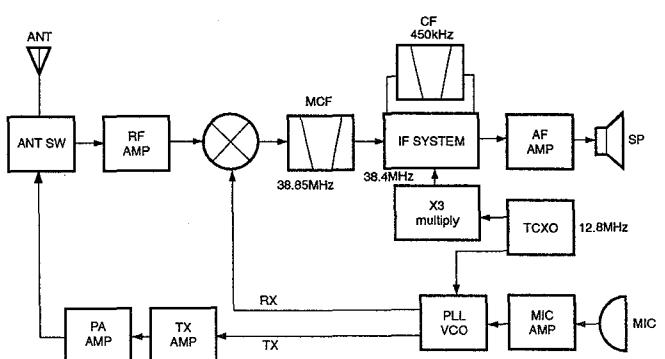

Fig. 1 Frequency configuration

2. Receiver

The receiver is double conversion superheterodyne, designed to operate in the frequency range of 446.0 to 446.1MHz. The frequency configuration is shown in Fig. 1.

1) Front - end RF amplifier

An incoming signal from the antenna is applied to an RF amplifier (Q203) after passing through a transmit/receive switch circuit (D102 is off) and a 3-pole LC filter. After the signal is amplified (Q203), the signal is filtered by a band pass filter (a 3-pole LC filter) to eliminate unwanted signals before it is passed to the first mixer. (See Fig.2)

2) First Mixer

The signal from the RF amplifier is heterodyned with the first local oscillator signal from the PLL frequency synthesizer circuit at the first mixer (Q202) to create a 38.85MHz first intermediate frequency (1st IF) signal. The first IF signal is then fed through two monolithic crystal filters (MCFs : XF200) to further remove spurious signals.

3) IF amplifier

The first IF signal is amplified by Q201, and then enters IC200 (FM processing IC). The signal is heterodyned again with a second local oscillator signal within IC200 to create a 450kHz second IF signal. The second IF signal is then fed through a 450kHz ceramic filter (CF200) to further eliminate unwanted signals before it is amplified and FM detected in IC200.

XF200:L71-0549-05

Item	Rating
Nominal center frequency	38.850MHz
Pass band width	$\pm 3.75\text{kHz}$ or more at 3dB
35dB stop band width	$\pm 15.0\text{kHz}$ or less
Ripple	1.5dB or less
Insertion loss	4.0dB or less
Guaranteed attenuation	80dB or more at $f_0-900\text{kHz}$
Terminal impedance	$560\Omega / 5\text{PF}$

CF200:L72-0971-05

Item	Rating
Nominal center frequency	450kHz
6dB band width	$\pm 4.5\text{kHz}$ or more
50dB band width	$\pm 10.0\text{kHz}$ or less
Ripple	2.0dB or less at $f_0 \pm 4\text{kHz}$
Insertion loss	6.0dB or less
Guaranteed attenuation	35.0dB or more at $f_0 \pm 100\text{Hz}$
Terminal impedance	$2.0\text{k}\Omega$

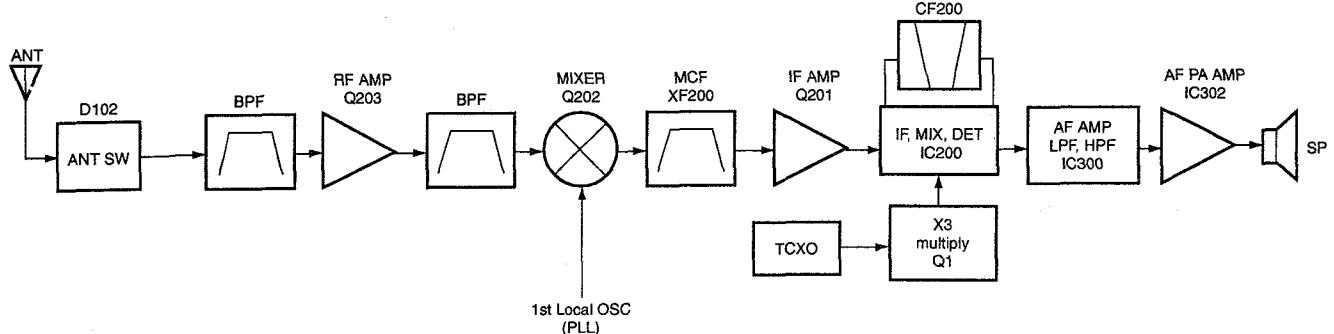

Fig. 2 Receiver section configuration

CIRCUIT DESCRIPTION

4) AF amplifier

The recovered AF signal obtained from IC200 is amplified by IC300 (1/4), filtered by the IC300 low-pass filter (2/4) and IC300 high-pass filter (3/4) and (4/4), and de-emphasized by R303 and C306. The processed AF signal passes through an AF volume control and is amplified to a sufficient level to drive a loud speaker by an audio power amplifier (IC302).

5) Squelch

Part of the AF signal from the IC enters the FM IC again, and the noise component is amplified and rectified by a filter and an amplifier to produce a DC voltage corresponding to the noise level.

The DC signal from the FM IC goes to the analog port of the microprocessor (IC403). IC403 determines whether to output sounds from the speaker by checking whether the input voltage is higher or lower than the preset value.

To output sounds from the speaker, IC403 sends a high signal to the MUTE and AFCO lines and turns IC302 on through Q304, Q305, Q306 and Q307. (See Fig. 3)

6) Receive signaling

QT/DQT

300 Hz and higher audio frequencies of the output signal from IF IC are cut by a low-pass filter (IC301). The resulting signal enters the microprocessor (IC403). IC403 determines whether the QT or DQT matches the preset value, and controls the MUTE and AFCO and the speaker output sounds according to the squelch results.

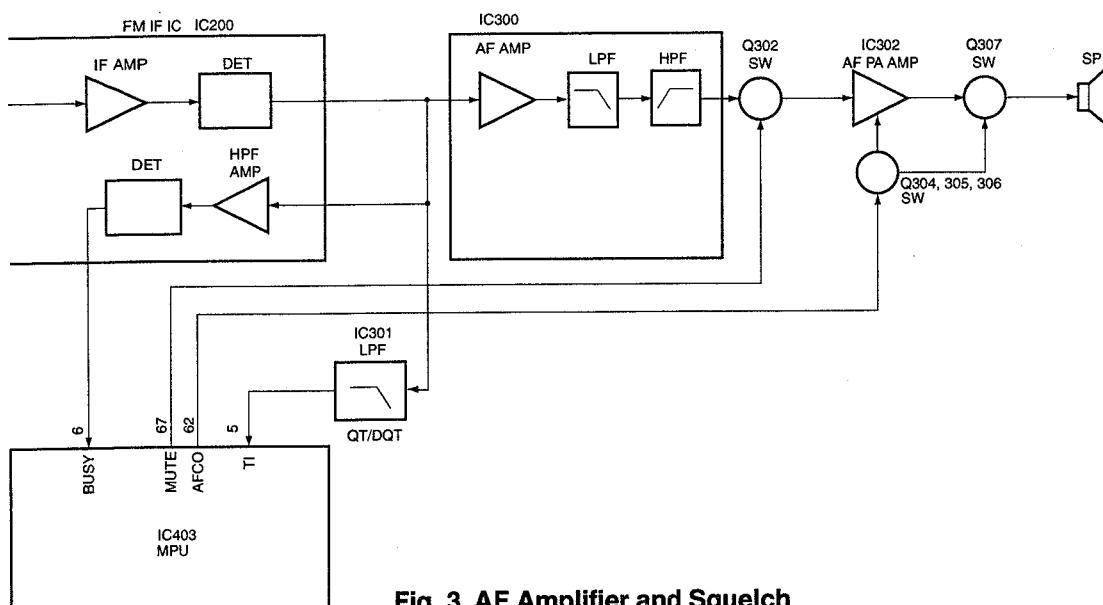

Fig. 3 AF Amplifier and Squelch

3. PLL frequency synthesizer

The PLL circuit generates the first local oscillator signal for reception and the RF signal for transmission.

1) PLL

The frequency step of the PLL circuit is 5 or 6.25kHz. A 12.8MHz reference oscillator signal is divided at IC1 by a fixed counter to produce the 5 or 6.25kHz reference frequency. The voltage controlled oscillator (VCO) output signal is buffer amplified by Q6, then divided in IC1 by a dual-module programmable counter. The divided signal is compared in phase with the 5 or 6.25kHz reference signal in the phase comparator in IC1. The output signal from the phase comparator is filtered through a low-pass filter and passed to the VCO to control the oscillator frequency. (See Fig. 4)

2) VCO

The operating frequency is generated by Q4 in transmit mode and Q3 in receive mode. The oscillator frequency is controlled by applying the VCO control voltage, obtained from the phase comparator, to the varactor diodes (D2 and D4 in transmit mode and D1 and D3 in receive mode). The T/R pin is set high in receive mode causing Q5 and Q7 to turn Q4 off, and Q3 on. The T/R pin is set low in transmit mode. The outputs from Q3 and Q4 are amplified by Q6 and sent to the buffer amplifiers.

TK-3101

CIRCUIT DESCRIPTION

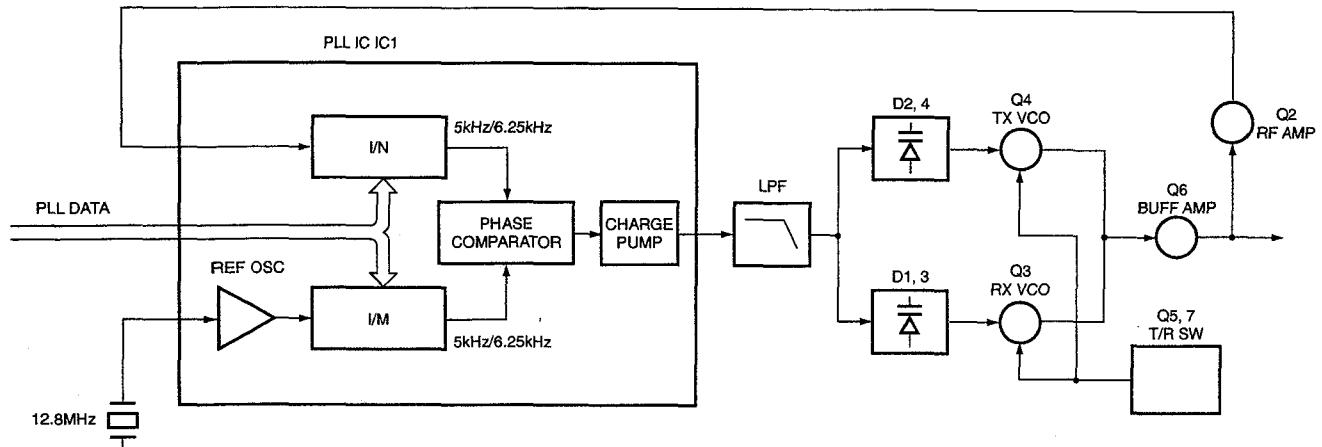

Fig. 4 PLL circuit

3) UNLOCK DETECTOR

If a pulse signal appears at the LD pin of IC1, an unlock condition occurs, and the DC voltage, obtained from D7, R6, and C1 causes the voltage applied to the UL pin of the microprocessor to go low. When the microprocessor detects this condition, the transmitter is disabled, ignoring the push-to-talk switch input signal. (See Fig.5)

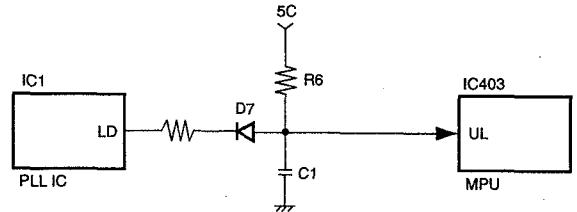

Fig. 5 Unlock detector circuit

4. Transmitter

1) Transmit audio

The modulation signal from the microphone is amplified by IC500 (1/2), passes through a preemphasis circuit, and amplified by the other IC500 (1/2) to perform IDC operation. The signal then passes through a low-pass filter (splatter filter) (Q501 and Q502) and cuts 3kHz and higher frequencies. The resulting signal goes to the VCO through the VCO modulation terminal for direct FM modulation. (See Fig. 6)

2) QT/DQT encoder

A necessary signal for QT/DQT encoding is generated by IC403 and FM-modulated to the PLL reference signal. Since the reference OSC does not modulate the loop characteristic frequency or higher, modulation is performed at the VCO side by adjusting the balance. (See Fig. 6)

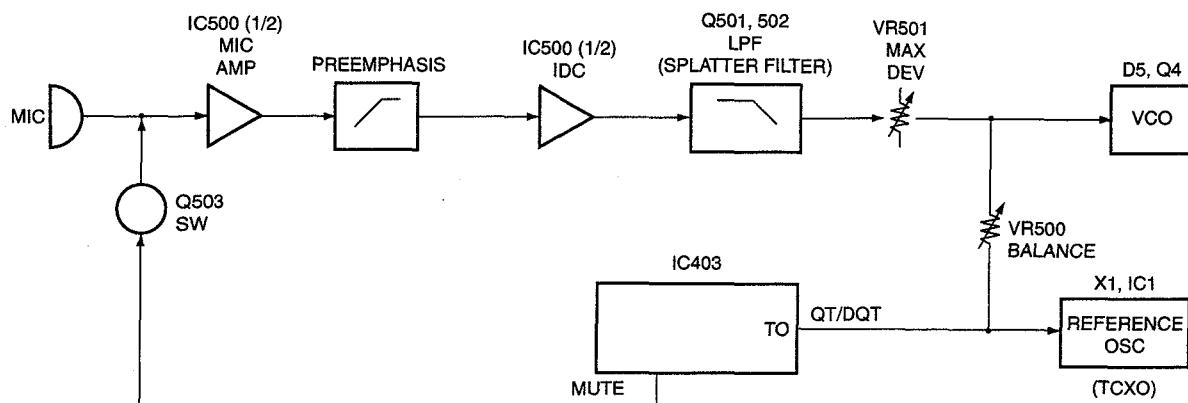

Fig. 6 Transmit audio QT/DQT

CIRCUIT DESCRIPTION

3) VCO and RF amplifier

The transmit signal obtained from the VCO buffer amplifier Q100, is amplified by Q101, Q102. This amplified signal is passed to the power amplifier, Q105 and Q107, which consists of a 2-stage FET amplifier and is capable of producing up to 500mW ERP of RF power. (See Fig.7)

4) ANT switch and LPF

The RF amplifier output signal is passed through a low-pass filter network and a transmit/receive switching circuit before it is passed to the antenna terminal. The transmit/receive switching circuit is comprised of D101 and D102. D102 is turned on (conductive) in transmit mode and off (isolated) in receive mode.

5) APC

The automatic power control (APC) circuit stabilizes the transmitter output power at a predetermined level by sensing the drain current of the final amplifier Field Effect Transistor (FET). The voltage comparator, IC100 (2/2), compares the voltage obtained from the above drain current with a reference voltage which is set using the microprocessor. An APC voltage proportional to the difference between the sensed voltage and the reference voltage appears at the output of IC100 (1/2). This output voltage controls the gate of the FET power amplifier, which keeps the transmitter output power constant. The transmitter output power can be varied by the microprocessor which in turn changes the reference voltage and hence, the output power.

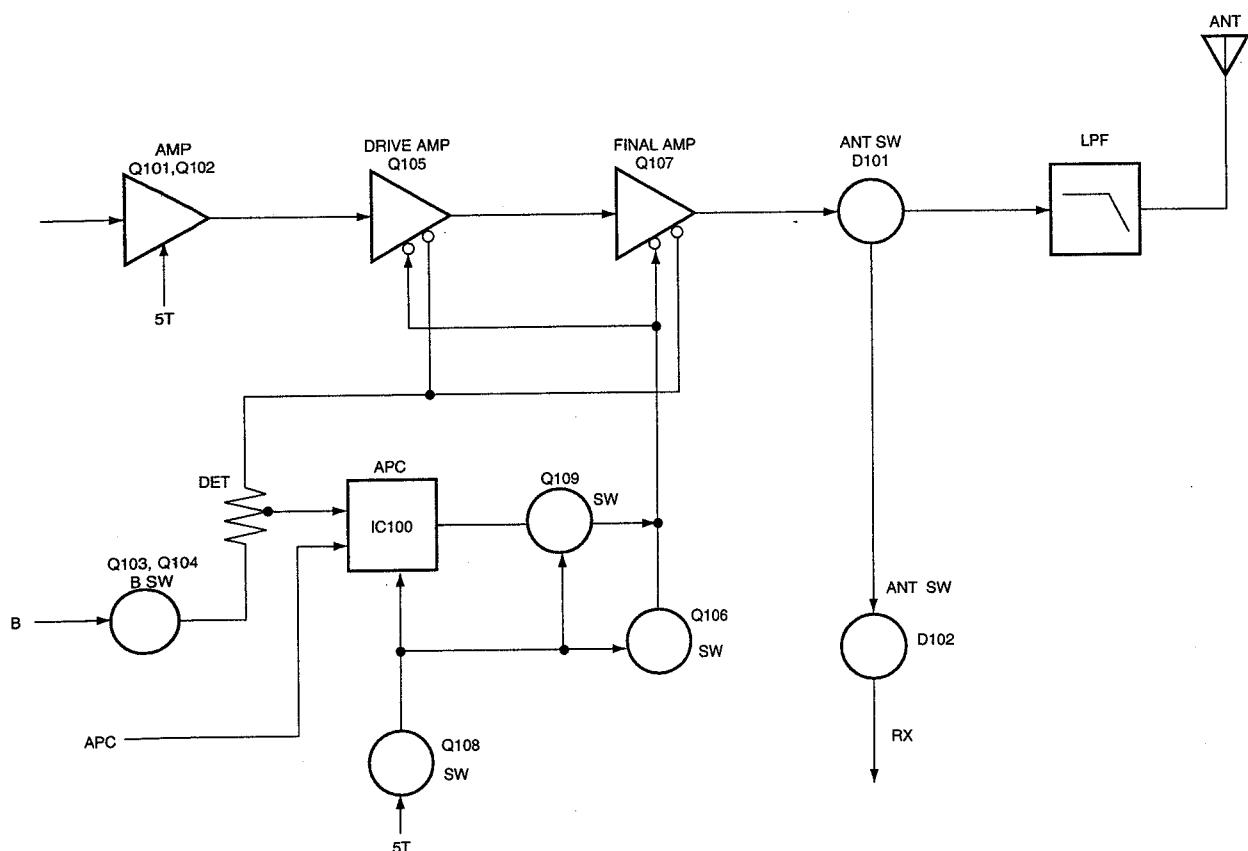

Fig. 7 APC system

5. Power supply

A 5V reference power [5M] supply for the control circuit is derived from an internal battery. This reference is used to provide a 5V supply in transmit mode [5T], a 5V supply in receive mode [5R], and a 5V supply common in both modes [5C] based on the control signal sent from the microprocessor.

6. Control system

The IC1 CPU operates at 7.37 MHz. This oscillator has a circuit that shifts the frequency according to the EEPROM data.

EXPLODED VIEW

Parts with exploded numbers larger than 700 are not supplied.

TK-3101

PACKING

ADJUSTMENT

Required Test Equipment

1. Stabilized Power supply

1. The supply voltage can be changed between 5V and 18V, and the current is 3A or more.
2. The standard voltage is 7.5V.

2. DC Ammeter

1. Class 1 ammeter (17 ranges and other features).
2. The full scale can be set to either 300mA or 3A.
3. A cable of less internal loss must be used.

3. Frequency Counter (f. counter)

1. Frequencies of up to 1GHz or so can be measured.
2. The sensitivity can be changed to 500MHz or below, and measurements are highly stable and accurate (0.2ppm or so).

4. Power Meter

1. Measurable frequency : Up to 600MHz
2. Impedance : 50Ω , unbalanced
3. Measuring range : Full scale of 5W or so
4. A standard cable (5D2W 1m) must be used.

5. RF Voltmeter(RF V.M)

1. Measurable frequency : Up to 600MHz or so.

6. Linear Detector

1. Measurable frequency : Up to 600MHz or so
2. Characteristics are flat, and CN is 60dB or more.

7. Digital Voltmeter

1. Voltage range : FS=18V or so
2. Input resistance : $1M\Omega$ or more

8. Oscilloscope

1. Measuring range : DC to 30MHz
2. Provides highly accurate measurements for 5 to 25MHz.

9. AF Voltmeter (AF V.M)

1. Measurable frequency : 50Hz to 1MHz
2. Maximum sensitivity : 1mV or more

10. Spectrum Analyzer

1. Measuring range : DC to 1GHz or more

11. Standard Signal Generator (SSG)

1. Maximum frequency : 600MHz or more
2. Output : -133dBm/0.05 μ V to 7dBm/501mV
3. Output impedance : 50Ω

12. Tracking Generator

1. Center frequency : 50kHz to 600MHz
2. Frequency deviation : ± 35 MHz
3. Output voltage : 100mV or more

13. Dummy Load

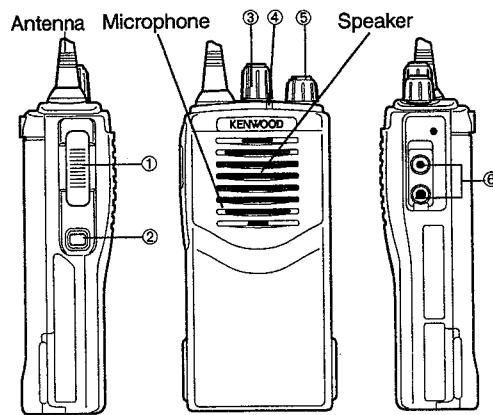

1. 8Ω , 3W or more

14. AF Generator(AG)

1. Frequency range : 100Hz to 100kHz
2. Output : 0.5mV to 1V

15. Distortion Meter

1. Measurable frequency : 30Hz to 100kHz
2. Input level : 50mV to 10Vrms

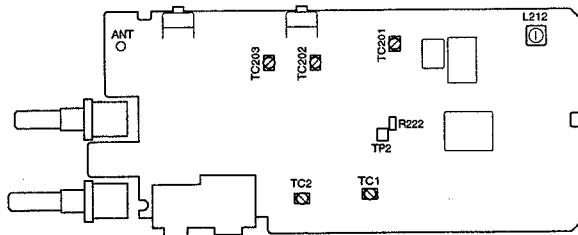

① PTT switch
② Monitor key
③ Channel selector

④ LED indicator
⑤ Power switch/Volume control
⑥ SP/MIC JACK

- Use a non-conductive rod such as a Bakelite rod for adjustment (especially of trimmers and coils).
- To protect the SSG, do not send out signals while adjusting the receiving unit.
- The indicated SSG output levels are for maximum output.

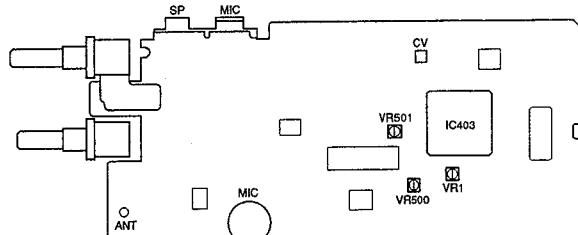

Adjustment points

Foil Side View

L212: AF level adjustment
TC1: Transmit lock
TC2: Receive lock voltage
TC201: RF-Band-pass filter waveform adjustment
TC202: Band-pass filter test point
TC203: Band-pass filter adjustment
TP2: Band-pass filter test point

Component Side View

ANT: Antenna terminal
SP: Speaker jack
MIC: Microphone jack
CV: Lock voltage adjustment terminal
VR500: DQT waveform adjustment
VR501: DEV adjustment

Note : To fine tune the frequency when not using a computer, adjust VR1.

TK-3101

ADJUSTMENT

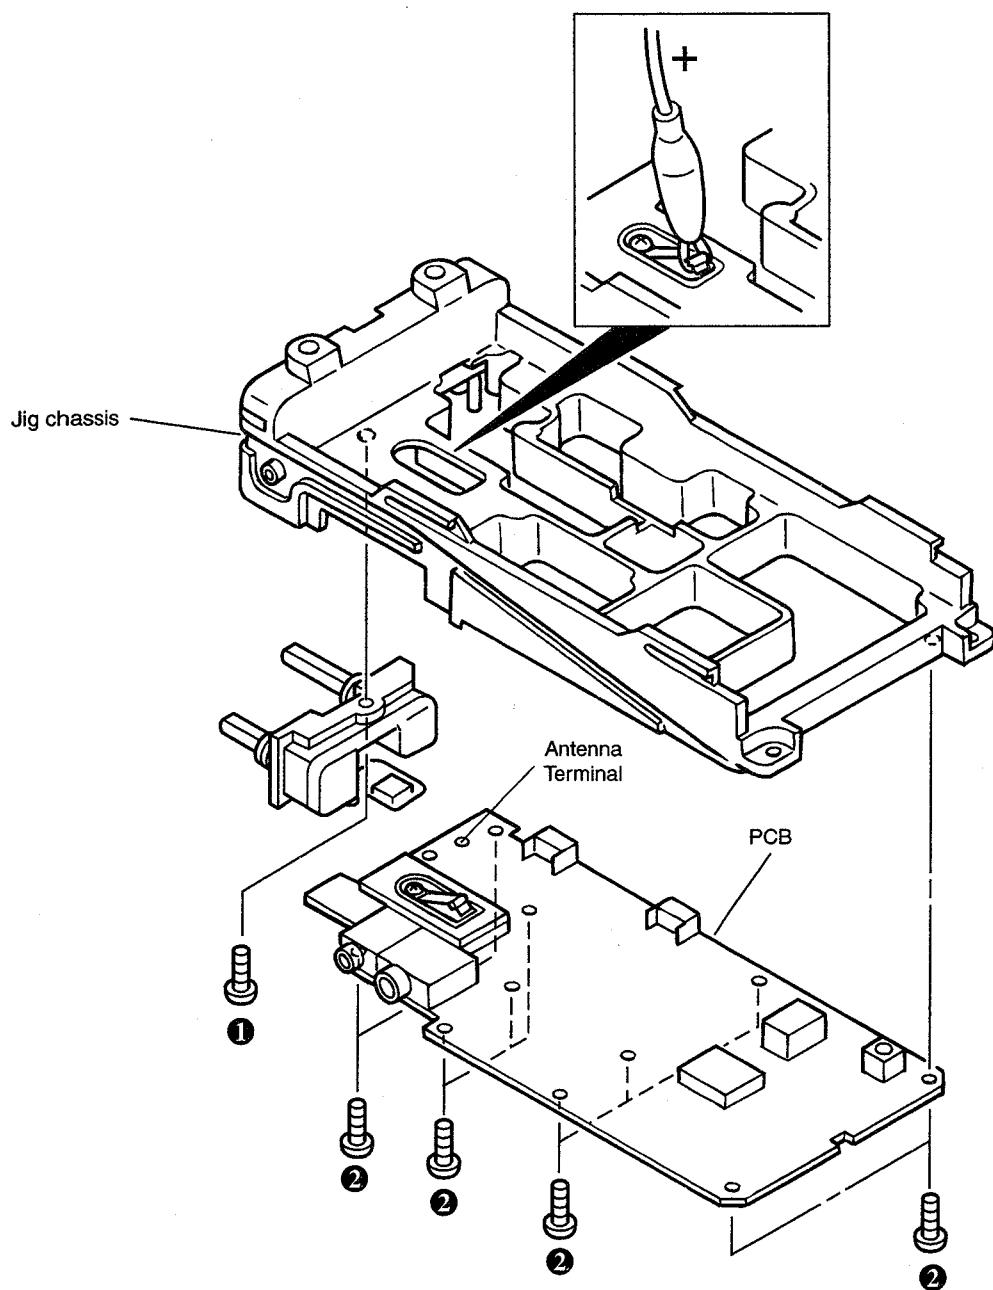

1. Jig chassis for adjustment. (part number W05-0740-00)

2. Use the jig chassis as follows.

1. Attach the switches to the jig chassis and secure it with its screw ①.
2. Attach the PCB to the jig chassis and secure it with its 11 screws ②.
3. Solder the antenna connector to the antenna terminal of the PCB.

Notes: Supply power from an external power supply.

(Relay terminal:+)
Jig chassis:-

ADJUSTMENT

Use the KPG-54D programming software for adjustment of the next item in PC MODE.

Squelch Level, Transmit frequency, DQT Balance, RF Power, QT Deviation, DQT Deviation, Battery Level
