GENERAL

INTRODUCTION

SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of this publication date. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions, which are issued as required.

ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts : components, kits, and chassis. If the part number is not known, include the chassis or kit number of which it is a part and a sufficient description of the required component for proper identification.

PERSONNEL SAFETY

The following precautions are recommended for personnel safety :

- DO NOT transmit if someone is within two feet (0.6 meter) of the antenna.
- DO NOT transmit until all RF connectors are secure and any open connectors are properly terminated.
- SHUT this equipment when near electrical blasting caps or while in an explosive atmosphere.
- All equipment should be properly grounded before power-up for safe operation.
- This equipment should be serviced by only qualified technicians.

PRE-INSTALLATION CONSIDERATIONS

1. UNPACKING

Unpack the radio from its shipping container and check for accessory items. If any item is missing, please contact KENWOOD immediately.

2. LICENSING REQUIREMENTS

Federal regulations require a station license for each radio installation (mobile or base) be obtained by the equipment owner. The licensee is responsible for ensuring transmitter power, frequency, and deviation are within the limits permitted by the station license.

Transmitter adjustments may be performed only by a licensed technician holding an FCC first, second or general class commercial radiotelephone operator's license. There is no license required to install or operate the radio.

GENERAL

3. PRE-INSTALLATION CHECKOUT

3-1. Introduction

Each radio is adjusted and tested before shipment. However, it is recommended that receiver and transmitter operation be checked for proper operation before installation.

3-2. Testing

The radio should be tested complete with all cabling and accessories as they will be connected in the final installation. Transmitter frequency, deviation, and power output should be checked, as should receiver sensitivity, squelch operation, and audio output. QT equipment operation should be verified.

4. PLANNING THE INSTALLATION

4-1. General

Inspect the vehicle and determine how and where the radio antenna and accessories will be mounted.

Plan cable runs for protection against pinching or crushing wiring, and radio installation to prevent overheating.

4-2. Antenna

The favored location for an antenna is in the center of a large, flat conductive area, usually at the roof center. The trunk lid is preferred, bond the trunk lid and vehicle chassis using ground straps to ensure the lid is at chassis ground.

4-3. Radio

The universal mount bracket allows the radio to be mounted in a variety of ways. Be sure the mounting surface is adequate to support the radio's weight. Allow sufficient space around the radio for air cooling. Position the radio close enough to the vehicle operator to permit easy access to the controls when driving.

4-4. DC Power and wiring

1. This radio may be installed in negative ground electrical systems only. Reverse polarity will cause the cable fuse to blow. Check the vehicle ground polarity before installation to prevent wasted time and effort.
2. Connect the positive power lead directly to the vehicle battery positive terminal. Connecting the Positive lead to any other positive voltage source in the vehicle is not recommended.
3. Connect the ground lead directly to the battery negative terminal.
4. The cable provided with the radio is sufficient to handle the maximum radio current demand. If the cable must be extended, be sure the additional wire is sufficient for the current to be carried and length of the added lead.

5. INSTALLATION PLANNING – CONTROL STATIONS

5-1. Antenna system

Control station. The antenna system selection depends on many factors and is beyond the scope of this manual. Your KENWOOD dealer can help you select an antenna system that will best serve your particular needs.

5-2. Radio location

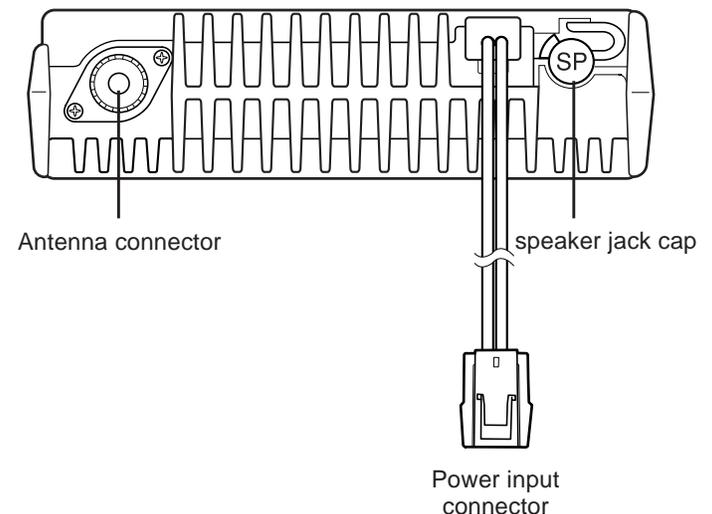

Select a convenient location for your control station radio which is as close as practical to the antenna cable entry point. Secondly, use your system's power supply (which supplies the voltage and current required for your system). Make sure sufficient air can flow around the radio and power supply to allow adequate cooling.

SERVICE

This radio is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained in this manual.

NOTE

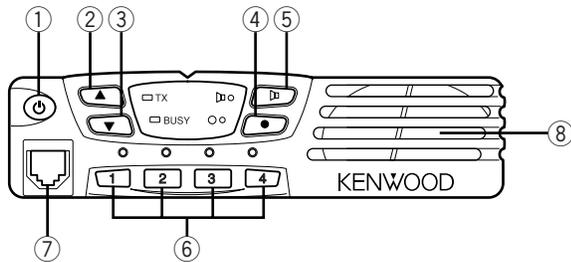

If you do not intend to use the 3.5-mm jack for the external speaker, fit the supplied speaker-jack cap to stop dust and sand getting in.

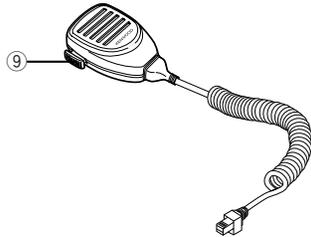

OPERATING FEATURES

1. Controls and Functions

1-1. Front Panel

1-2. Microphone

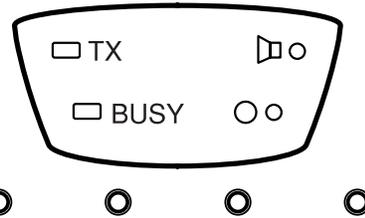

- ① **⏻** (Power) switch
Press to switch the transceiver ON. Press and hold for approximately 1 seconds to switch the transceiver OFF.
- ② **▲** key
Press to increase the volume level.
- ③ **▼** key
Press to decrease the volume level.
- ④ **●** key
PF (Programmable Function) key. The default setting of this key is None (no function). The programmable functions available for this key are listed below.
- ⑤ **🔊** key
PF (Programmable Function) key. The default setting of this key is Monitor (page 5). Other programmable functions available for this key are listed below.
- ⑥ **1/2/3/4** keys
Press to select a channel from 1 to 4.
- ⑦ **🎧** Microphone jack
Insert the microphone plug into this jack (the microphone is an optional accessory).
- ⑧ **🔊** Speaker
Internal speaker.
- ⑨ **🗣️** PTT switch
Press this switch, then speak into the microphone to call a station.

1-3. Auxiliary Programmable Functions:

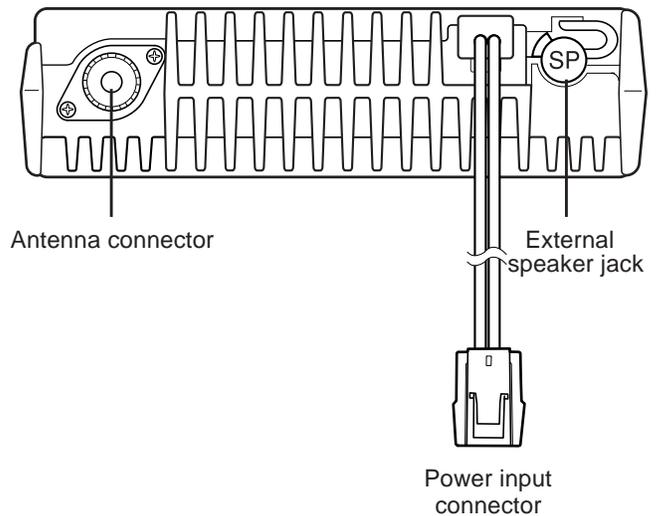

- Emergency
- Key Lock
- Monitor
- None (no function)
- Scan On/OFF
- Talk Around
- Temporary Delete

1-4. Display

| Indicator | Description |
|-----------|---|
| □ TX | Light while transmitting. |
| □ BUSY | Lights when a signal is detected on the currently selected channel. |
| 🔊 | Lights while the function programmed onto its corresponding key is activated. |
| ○ ○ | Lights while the function programmed onto its corresponding key is activated. |
| ○ ○ ○ ○ | Lights to display the currently selected channel (1~ 4) |

1-5. Rear panel

OPERATING FEATURES

2. Operation Features

The TK-8102 is a UHF FM radio designed to operate in conventional format. The programmable features are summarized.

3. Transceiver Controls and Indicators

3-1. Front Panel Controls

All the keys on the front panel are momentary-type push buttons. The functions of these keys are explained below.

- **POWER key**

Transceiver POWER key. When the power is switched off, all the parameters are stored in memory. When the power is switched on again, the transceiver returns to the previous conditions.

- **CHANNEL Keys**

- **MONITOR key (Programmable)**

- **● key (Programmable)**

- **VOLUME UP/DOWN key**

When the key is pressed, the volume level is increased/decreased and repeats if held for 200ms or longer.

- **BUSY/TX LED**

The BUSY indicator (Green LED) shows that the channel is in use. The TX indicator (Red LED) shows that you are transmitting.

3-2. Programmable Keys

The FPU (KPG-70D) enables programmable keys to select the following functions.

- Emergency
- Key Lock
- Monitor
- Scan ON/OFF
- Talk Around
- Temporary Delete
- None

- **Emergency**

Pressing this key for longer than 1 second causes the transceiver to enter the emergency mode. The transceiver jumps to the programmed "Emergency channel" and transmits for 25* seconds.

The transceiver disables mic mute while transmitting. After finishing transmission, the transceiver receives for 5* seconds. The transceiver Mute* the speaker while receiving. Following the above sequence, the transceiver continues to transmit and receive.

* Default value

- **Key lock**

Pressing this key causes the transceiver to accept entry of only the [Vol Up/Down]*, [Key lock], Microphone [PTT], [Monitor], [Emergency], and [Power] keys.

* Programmable

- **Monitor**

Used to release signalling (press once) or squelch (press and hold for approximately two seconds) when operating as a conventional. It is also used to reset option signalling.

- **Scan ON/OFF**

Press this key starts scanning. Pressing this key stops scanning.

- **Talk around**

Press this key, the transceiver uses the receive frequency and the tone for transmission.

The operator can call the other party directly (without repeater). Press this key again, the talk around function goes off.

- **Temporary delete**

The "Add" channel contained in the scan sequence, and "Delete" channel is not contained. In the scan mode, this key switches the channel delete temporarily (Press and hold for approximately one second).

When the transceiver is turned off, the transceiver exits the scan or switches the scan function off.

- **None**

Sounds error operation beep, and no action will occur. Use this function when the transceiver is required to be more simple operated.

4. Scan Operating

■ SCAN start condition

Two or more channels must be added to all channels that can be scanned. The transceiver must be in normal receive mode (PTT off).

When you activate the key programmed to the scan ON/OFF function, the scan starts. The indicator next to the programmed key LED blinks.

■ Scan stop condition

The scan stops temporarily if the following conditions are satisfied.

- 1) A carrier is detected, then QT/DQT matches on channels for which receive the QT/DQT is set by the programming software.
- 2) A carrier is detected on the channels for which receiving QT/DQT is not set by the programming software or when the monitor (signalling cancel) function is activated.

■ Revert channel

The revert channel is used to transmit during scanning and set by the programming software (KPG-70D).

- 1) Selected channel

The transceiver reverts to the channel before scanning or the channel that you changed during scan.

- 2) Selected with talkback

The transceiver reverts to the selected channel prior to scan initiation.

However, if a call is received on a channel other than the selected channel and PTT is pressed before scanning resume, the transceiver "talks back" on the current receive channel.

■ Scan end

When you press the key programmed to the scan function during scan mode, the scan ends.

The indicator next to the programmed key LED turns off.

OPERATING FEATURES

■ Temporary delete

It is possible to delete channel temporary during scan. When scan stops on unnecessary channel for example by interference of the other party, activate the delete function (for example press and hold the key for approximately one second), then that channel is deleted temporarily and scan re-start immediately.

The temporary deleted channels return to pre-set delete/add channels, when the transceiver is turned off or the scan function is switched off.

5. Details of Features

■ Time-out timer

The time-out timer can be programmed in 30 seconds increments from 30 seconds to five minutes and off. If the transmitter is transmitted continuously for longer than the programmed time, the transmitter is disabled and a warning tone sounds while the PTT button is held down. The warning tone stops when the PTT button is released.

■ PTT ID

PTT ID provides a DTMF ANI to be sent with every time PTT (beginning of transmission, end of transmission, or both).

You can program PTT ID "on" or "off" for each channel. The contents of ID are programmed each Radio.

The timing that the transceiver sends ID is programmable.

BOT : DTMF ID (Beginning of TX) is sent on beginning of transmission.

EOT : DTMF ID (End of TX) is sent on end of transmission.

Both : DTMF ID (Beginning of TX) is sent on beginning of transmission and DTMF ID (End of TX) is sent on end of transmission.

■ Off hook decode

If the Off hook decode function has been enabled, removing and replacing the microphone on the hook has no effect for decoding QT/DQT and option signalling.

■ "TOT" pre-alert

The transceiver has "TOT" pre-alert timer. This parameter selects the time at which the transceiver generates "TOT" pre-alert tone before "TOT" is expired.

"TOT" will be expired when the selected time passes from a TOT pre-alert tone.

■ "TOT" re-key time

The transceiver has "TOT" re-key timer. This timer is the time you can not transmit after "TOT" exceeded. After "TOT" re-key time expired you can transmit again.

■ "TOT" reset time

The transceiver has "TOT" reset timer. This timer is the minimum wait time allowed during a transmission that will reset the "TOT" count.

"TOT" reset time causes the "TOT" to continue even after PTT is released unless the "TOT" reset timer has expired.

■ Clear to transpond

The transceiver waits the transpond of DTMF if channel is busy until channel open. This feature prevents the interference to other party.

6. Option Signalling (DTMF)

Built-in DTMF decoder is available for option signalling.

It is possible to use individual call, group call, Stun.

If the option signalling matches, a predetermined action will occur.

If option signalling matches on a channel is set up with option signalling, the channel LED will flash and option signalling will be released. The transpond or alert tone will sound.

While option signalling matches (or if option signalling is deactivated when you are transmitting), you can mute or unmute QT/DQT/Carrier.

■ SP Unmute

You can select the type of SP Unmute system for each channel. The selection is as follows.

Carrier, QT/DQT:

Channel with this option will not check ID Code in order to open its speaker.

Carrier+DTMF, QT/DQT+DTMF:

Channel that is set with this option will have to check for ID Code in order to open its speaker.

Default:

Carrier, QT/DQT.

| SP Unmute | Channel Setting | | RX Condition | Speaker Condition |
|--------------|-----------------|------|-------------------------------------|----------------------|
| | QT/DQT | DTMF | | |
| Carrier | None | None | Carrier | Sounds |
| | | Yes | Carrier Carrier+DTMF | Sounds |
| Carrier+DTMF | None | Yes | Carrier | Not Sounds |
| | | | Carrier+DTMF | Sounds |
| QT/DQT | Yes | None | Carrier | Not Sounds |
| | | | Carrier+QT/DQT | Sounds |
| | | Yes | Carrier+QT/DQT | Sounds |
| | | | Carrier+QT/DQT+DTMF Carrier+DTMF | Sounds Not Sounds |
| QT/DQT+DTMF | Yes | Yes | Carrier | Not Sounds |
| | | | Carrier+QT/DQT | Not Sounds |
| | | | Carrier+QT/DQT+DTMF | Sounds |
| | | | Carrier+DTMF | Not Sounds |

Note:

When QT/DQT is not used, QT/DQT and QT/DQT+DTMF can not be selected.

When DTMF is not used, Carrier+DTMF and QT/DQT+DTMF can not be selected.

■ Auto Reset

If option signalling matches a group set up with option signalling, option signalling is released. After matching option signalling, option signalling will temporarily reset automatically.

OPERATING FEATURES / REALIGNMENT

■ Stun

If the stun code matches, a predetermined action will occur. Whether option signalling is activated or not, when stun matches on any channel, the transceiver will become TX inhibited or TX/RX inhibited. While stun is active, if the stun code + "#" code is received, stun will deactivate.

When stun matches, transpond will function. Alert will not be output.

7. Audible User Feedback Tones

The transceiver outputs various combinations of tones to notify the user of the transceiver operating state.

Refer to the help file on the KPG-70D, regarding the functions that are not listed below.

■ Stun on tone

When a stun code is received, transpond tone sounds.

■ Stun off tone

When a stun release code is received, transpond tone sounds.

■ Group call tone

Sounds when a group call with the correct DTMF option signalling is received, repeats 7 times. You can select yes or no in the Alert tone level setting.

■ Individual call tone

Sounds when an individual call with the correct DTMF option signalling is received. You can select yes or no in the Alert tone level setting.

■ Key input error tone

Sounds when a key is pressed but that key cannot be used. You can select yes or no for the optional feature's warning tone.

■ Transpond tone

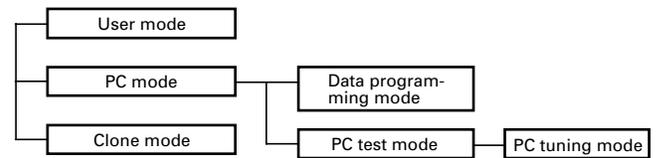

Sounds when an individual call with the correct DTMF option signalling is received. For group calls, only the group tone will sound, not the transpond tone.

■ Pre alert tone

Sounds prior to the TOT TX inhibit activation. If TOT pre alert is set, the tone sounds at the amount of time programmed, before the TOT expires (TOT time – TOT pre alert time = Pre alert tone sounding time). You can select yes or no for the optional feature's warning tone.

REALIGNMENT

1. Modes

| Mode | Function |
|-----------------------|---|
| User mode | For normal use. |
| PC mode | Used for communication between the radio and PC (IBM compatible). |
| Data programming mode | Used to read and write frequency data and other features to and from the radio. |
| PC test mode | Used to check the radio using the PC. This feature is included in the FPU. |
| PC tuning mode | Used to tune the radio using the PC. |
| Clone mode | Used to transfer programming data from one radio to another. |

2. How to Enter Each Mode

| Mode | Operation |
|------------|----------------------------|
| User mode | Power ON |
| PC mode | Received commands from PC |
| Clone mode | [1]+Power ON (Two seconds) |

3. PC Mode

3-1. Preface

The TK-8102 transceiver is programmed using a personal computer, a programming interface (KPG-46) and programming software (KPG-70D).

The programming software can be used with an IBM PC or compatible. Figure 1 shows the setup of an IBM PC for programming.

3-2. Connection Procedure

1. Connect the TK-8102 to the personal computer with the interface cable.
2. When the Power is switched on, user mode can be entered immediately. When the PC sends a command, the radio enters PC mode.
When data is transmitted from transceiver, the red LED blink.
When data is received by the transceiver, the green LED blink.
In the PC mode, 4CH LEDs, [MON] LED and [●] LED are turned on.

Notes :

- The data stored in the personal computer must match model type when it is written into the EEPROM.
- Attach the interface cable, then change the TK-8102 to PC mode.

REALIGNMENT

3-3. KPG-46 Description

(PC programming interface cable : Option)

The KPG-46 is required to interface the TK-8102 to the computer. It has a circuit in its D-subconnector (25-pin) case that converts the RS-232C logic level to the TTL level.

The KPG-46 connects the modular microphone jack of the TK-8102 to the computers RS-232C serial port.

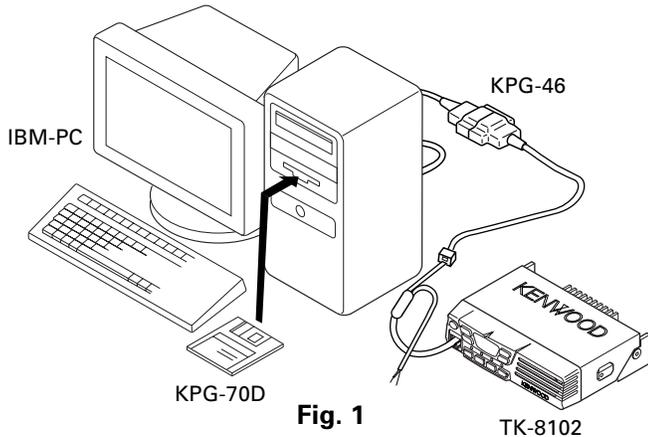

Fig. 1

3-4. Programming Software Description

The KPG-70D programming disk is supplied in 3-1/2" disk format. The software on this disk allows a user to program TK-8102 radio via a programming interface cable (KPG-46).

3-5. Programming With IBM PC

If data is transferred to the transceiver from an IBM PC with the KPG-70D, the destination data (basic radio information) for each set can be modified.

4. Clone Mode

Programming data can be transferred from one radio to another by connecting them via their modular microphone jacks. The operation is as follows (the transmit radio is the master and the receive radio is the slave).

NOTE: Clone mode should enabled.

1. Turn the master TK-8102 power ON with the [1] key held down. The TK-8102 [●] LED is turned on.
2. Power on the slave TK-8102.
3. Connect the cloning cable (No. E30-3382-05) to the modular microphone jacks on the master and slave.
4. Press the [●] key on the master TK-8102 transceiver. The data of the master is sent to the slave. While the master is sending data, [TX] LED blinked. While the slave is receiving the data, 4 LEDs, [MON] LED, [●] LED are turned on and [BUSY] LED blinked. When cloning of data is completed, the master [TX] LED turned off, and the slave automatically operates in the User mode. The slave can then be operated by the same program as the master.
5. The other slave can be continuously cloned. Carry out the operation in step 2 to 4.

Adding the data password.

If the data password is set in the optional feature menu, you must enter the password (Master transceiver) to activate a clone mode.

you can use 1, 2, 3, and 4 to configure the password. The maximum length of the password is 10 digits.

1. [1]+Power ON.
2. [1]~[4] LED, and MON LED are turned ON.
3. Enter the password using [1]~[4] keys.
4. Press [MON] key.
5. If the password matches, the transceiver enters a clone mode. Otherwise, transceiver beeps and returns to the password input mode.

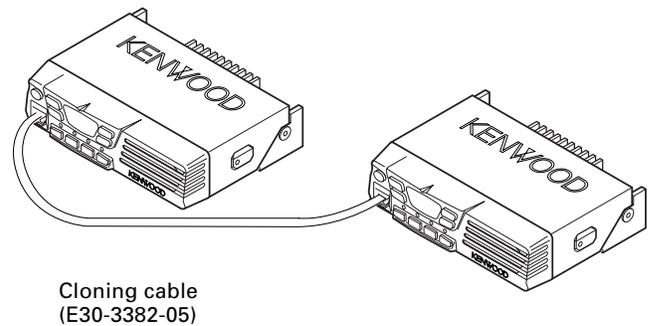

Fig. 2

DISASSEMBLY FOR REPAIR

1. When you remove the panel, turn the transceiver up side down. Detach the panel by lifting the tabs as shown below.

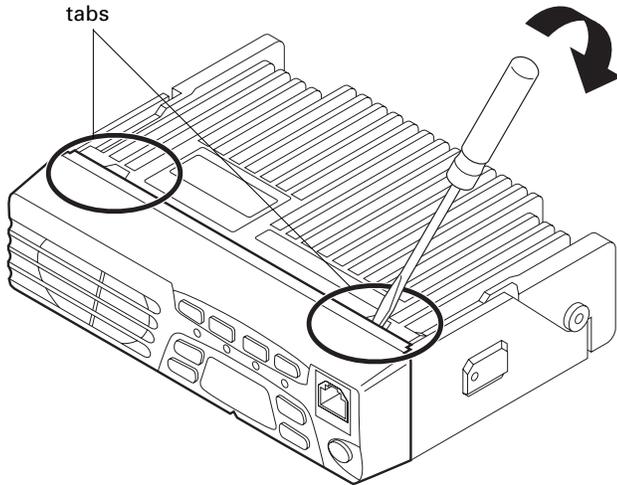

Fig. 1

3. To remove the display unit PCB, detach the PCB by lifting at the indents of the PCB as shown below.

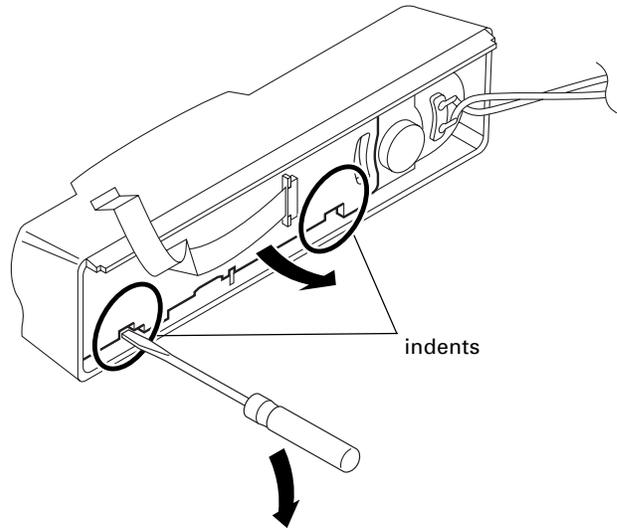

Fig. 3

2. To remove the cabinet, first turn the transceiver up side down. Detach the cabinet by prying the tabs as shown below.

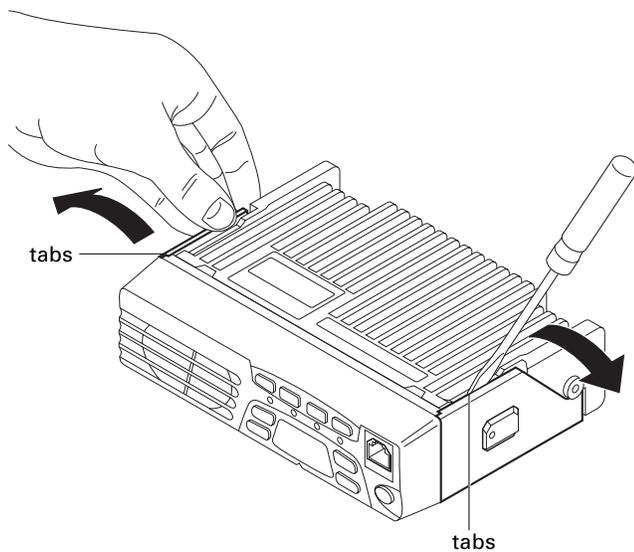

Fig. 2

4. When mounting the front panel, match the 4 tabs of the chassis with the panel, being sure they attach securely.

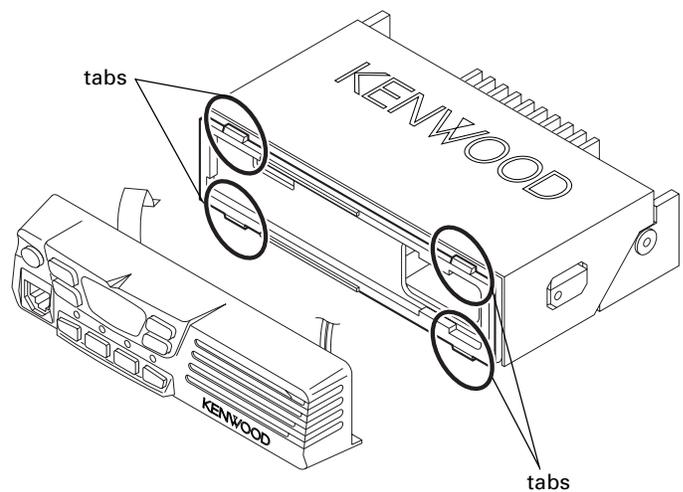

Fig. 4

CIRCUIT DESCRIPTION

Frequency Configuration

The receiver utilizes double conversion. The first IF is 49.95MHz and the second IF is 450kHz. The first local oscillator signal is supplied from the PLL circuit.

The PLL circuit in the transmitter generates the necessary frequencies. Figure 1 shows the frequencies.

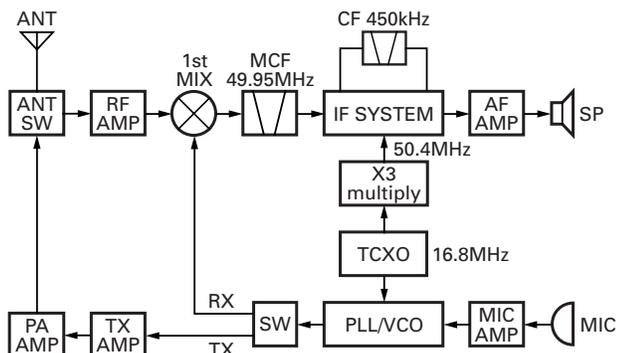

Fig. 1 Frequency configuration

Receiver System

The receiver is double conversion superheterodyne. The frequency configuration is shown in Figure 1.

■ Front-end RF Amplifier

An incoming signal from the antenna is applied to an RF amplifier (Q26) after passing through a transmit/receive switch circuit (D31 and D32 are off) and a BPF (L36, L38, L48, L49 and varactor diodes: D25, D26, D28). After the signal is amplified (Q26), the signal is filtered by a BPF (L30, L32 and varactor diodes: D21, D22) to eliminate unwanted signals before it is passed to the first mixer.

The voltage of these diodes are controlled by tracking the CPU (IC6) center frequency of the band pass filter. (See Fig. 2)

■ First Mixer

The signal from the RF amplifier is heterodyned with the first local oscillator signal from the PLL frequency synthesizer circuit at the first mixer (Q21) to create a 49.95MHz first intermediate frequency (1st IF) signal. The first IF signal is then fed through two monolithic crystal filters (MCFs : XF1) to further remove spurious signals.

■ IF Amplifier

The first IF signal is amplified by Q19, and the enters IC5 (FM processing IC). The signal is heterodyned again with a second local oscillator signal within IC5 to create a 450kHz second IF signal. The second IF signal is then fed through a 450kHz ceramic filter (Wide : CF1, Narrow : CF2) to further eliminate unwanted signals before it is amplified and FM detected in IC5.

| Item | Rating |
|--------------------------|--|
| Nominal center frequency | 49.95MHz |
| Pass bandwidth | ±5.0kHz or more at 3dB |
| 35dB stop bandwidth | ±20.0kHz or less |
| Ripple | 1.0dB or less |
| Insertion loss | 5.0dB or less |
| Guaranteed attenuation | 80dB or more at fo±1MHz |
| | Spurious : 40dB or more within fo±1MHz |
| Terminal impedance | 350Ω / 5.5pF |

Table 1 Crystal filter (L71-0591-05) : XF1

| Item | Rating |
|--------------------------|---------------------------------|
| Nominal center frequency | 450kHz |
| 6dB bandwidth | ±6.0kHz or more |
| 50dB bandwidth | ±12.5kHz or less |
| Ripple | 2.0dB or less |
| Insertion loss | 6.0dB or less |
| Guaranteed attenuation | 35.0dB or more within fo±100kHz |
| Terminal impedance | 2.0kΩ |

| Item | Rating |
|--------------------------|---------------------------------|
| Nominal center frequency | 450kHz |
| 6dB bandwidth | ±4.5kHz or more |
| 50dB bandwidth | ±10.0kHz or less |
| Ripple | 2.0dB or less |
| Insertion loss | 6.0dB or less |
| Guaranteed attenuation | 55.0dB or more within fo±100kHz |
| Terminal impedance | 2.0kΩ |

Table 3 Ceramic filter (L72-0994-05) : CF2

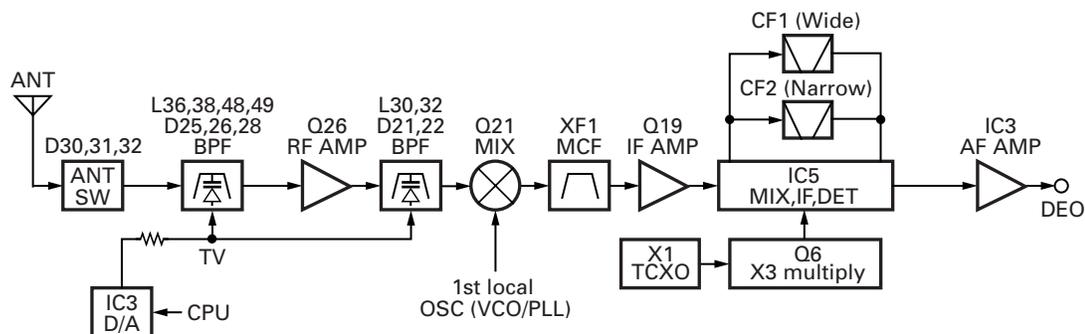

Fig. 2 Receiver system

CIRCUIT DESCRIPTION

Wide/Narrow Changeover Circuit

The Wide port (pin 92) and Narrow port (pin 91) of the CPU is used to switch between ceramic filters. When the Wide port is high, the ceramic filter SW diodes (D13, D15) cause CF1 to turn on to receive a Wide signal.

When the Narrow port is high, the ceramic filter SW diodes (D13, D15) cause CF2 to turn on to receive a Narrow signal.

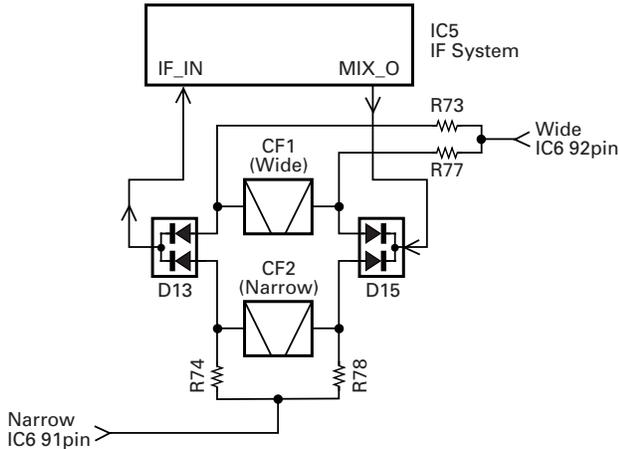

Fig. 3 Wide/Narrow changeover circuit

AF Signal System

The detection signal from IF IC (IC5) goes to AF amp (IC3) to adjust the gain and is output to AF filter (IC10) for characterizing the signal. The AF signal output from IC10 and the DTMF signal, BEEP signal are summed and the resulting signal goes to the D/A converter (IC3). The AFO output level is adjusted by the D/A converter. The signal output from the D/A converter is input to the audio power amplifier (IC16). The AF signal from IC16 switches between the internal speaker and speaker jack (J1) output.

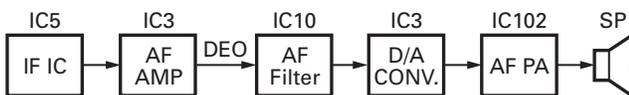

Fig. 4 AF signal system

Squelch Circuit

The detection output from the FM IF IC (IC5) passes through a noise amplifier (Q18) to detect noise. A voltage is applied to the CPU (IC6). The CPU controls squelch according to the voltage (SQIN) level. The signal from the RSSI pin of IC5 is monitored. The electric field strength of the receive signal can be known before the SQIN voltage is input to the CPU, and the scan stop speed is improved.

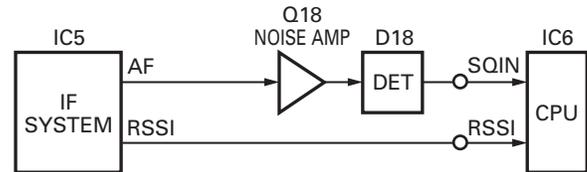

Fig. 5 Squelch circuit

PLL Frequency Synthesizer

The PLL circuit generates the first local oscillator signal for reception and the RF signal for transmission.

PLL

The frequency step of the PLL circuit is 5 or 6.25kHz. A 16.8MHz reference oscillator signal is divided at IC1 by a fixed counter to produce the 5 or 6.25kHz reference frequency. The voltage controlled oscillator (VCO) output signal is buffer amplified by Q15, then divided in IC1 by a dual-module programmable counter. The divided signal is compared in phase with the 5 or 6.25kHz reference signal in the phase comparator in IC1. The output signal from the phase comparator is filtered through a low-pass filter and passed to the VCO to control the oscillator frequency. (See Fig. 6)

VCO

The operating frequency is generated by Q11 in transmit mode and Q10 in receive mode. The oscillator frequency is controlled by applying the VCO control voltage, obtained from the phase comparator, to the varactor diodes (D10 and D12 in transmit mode and D9 and D11 in receive mode). The TX/RX pin is set low in receive mode causing Q12 and Q7 to turn Q11 off, and turn Q10 on. The TX/RX pin is set high in transmit mode. The outputs from Q10 and Q11 are amplified by Q15 and sent to the buffer amplifiers.

CIRCUIT DESCRIPTION

■ APC Circuit

The automatic transmission power control (APC) circuit detects part of a power module output with a diode (D34, D36) and applies a voltage to IC12. IC12 compares the APC control voltage (PC) generated by the D/A converter (IC3) and DC amplifier (IC4) with the detection output voltage to control Q27 and Q28, generates DB voltage from B voltage, and stabilizes transmission output.

The APC circuit is configured to protect over current of the power module due to fluctuations of the load at the antenna end and to stabilize transmission output at voltage and temperature variations.

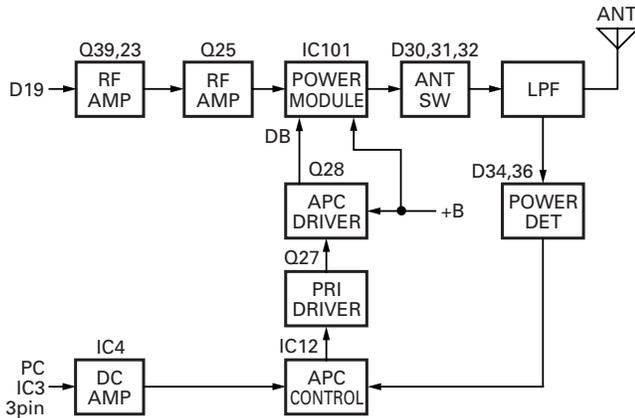

Fig. 9 APC circuit

Control Circuit

The CPU carries out the following tasks:

- 1) Controls the WIDE, NARROW, TX/RX outputs.
- 2) Adjusts the AF signal level of the AF filter (IC10) and turns the filter select compounder on or off.
- 3) Controls the DTMF decoder (IC9).
- 4) Controls the display unit.
- 5) Controls the PLL (IC1).
- 6) Controls the D/A converter (IC3) and adjusts the volume, modulation and transmission power.

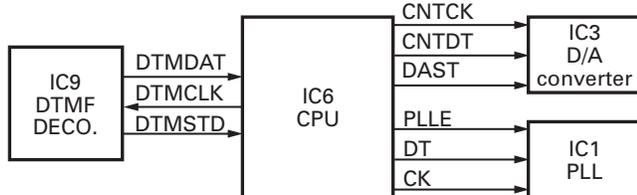

Fig. 10 Control circuit

■ Memory Circuit

The transceiver has an 8k-bit EEPROM (IC7). The EEPROM contains adjustment data. The CPU (IC6) controls the EEPROM through three serial data lines.

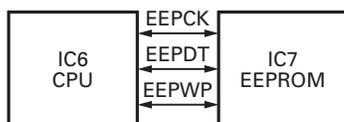

Fig. 11 Memory circuit

■ Display Circuit

The CPU (IC6) controls the display LEDs. When the transceiver is busy, the LEDG line goes high, Q4 turns on and the green LED (D11) lights. In transmit mode, the LEDR line goes high, Q8 turns on and the red LED (D12) lights. Backlit LEDs (D1~D4) are provided.

When a function key (MON, PF, C1, C2, C3 or C4) is selected, its respective line goes high (LED MON, LED PF, LED C1, LED C2, LED C3 or LED C4), the switch connected to that line turns on and the amber LED lights.

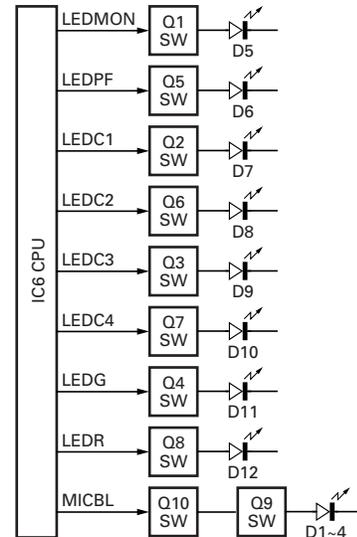

Fig. 12 Display circuit

■ Key Matrix Circuit

The TK-8102 front panel has function keys. Each of them is connected to a cross point of a matrix of the KMI1 to KMO2 ports of the microprocessor. The KMO1 to KMO2 ports are always high, while the KMI1 to KMI4 ports are always low.

The microprocessor monitors the status of the KMI1 to KMO2 ports. If the state of one of the ports changes, the microprocessor assumes that the key at the matrix point corresponding to that port has been pressed.

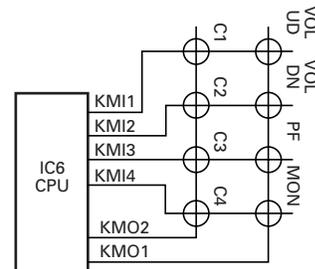

Fig. 13 Key matrix circuit

CIRCUIT DESCRIPTION

■ Encode

The QT and DQT signals are output from QT/DQT of the CPU (IC6) and summed with the external pin DI line by the summing amplifier (IC4) and the resulting signal goes to the D/A converter (IC3). The DTMF and signal is output from DTMF of the CPU and goes to the DIA converter (IC3). The signal is summed with a MIC signal by the summing amplifier (IC4), and the resulting signal goes to the D/A converter (IC3).

The D/A converter (IC3) adjusts the MO level and the balance between the MO and QT/DQT levels. Part of a QT/DQT signal is summed with MO and the resulting signal goes to the VCOMOD pin of the VCO. This signal is applied to a varicap diode in the VCO for direct FM modulation.

■ Decode

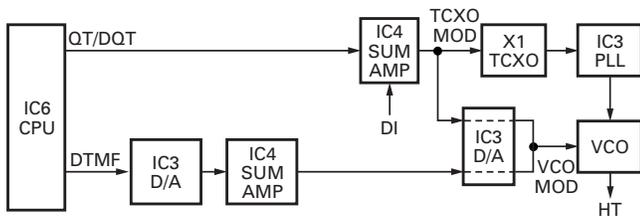

Fig. 14 Encode

• QT/DQT/DTMF

The signal (DEO) passes through two low-pass filters of IC11, goes to QTIN of the CPU (IC6) to decode QT, DQT. The DTMF signal is decoded by a dedicated IC (IC9) and the resulting signal is sent to the CPU (IC6) as serial data.

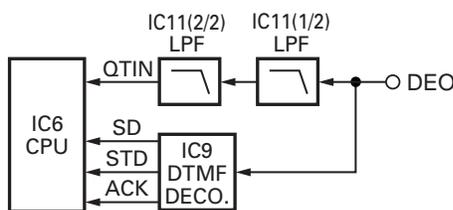

Fig. 15 Decode

■ D/A Converter

The D/A converter (IC3) is used to adjust MO modulation, AF volume, TV voltage, FC reference voltage, and PC POWER CONTROL voltage level.

Adjustment values are sent from the CPU as serial data. The D/A converter has a resolution of 256 and the following relationship is valid:

$$\text{D/A output} = (\text{Vin} - \text{VDAREF}) / 256 \times n + \text{VDAREF}$$

Vin: Analog input

VDAREF: D/A reference voltage

n: Serial data value from the microprocessor (CPU)

Power Supply Circuit

When the POWER switch on the display unit is pressed, the power port on the display unit which is connected to CPU port 18 (POWER), goes low, then CPU port 93 (SBC) goes high, Q34 turns on, SB SW (Q42) turns on and power (SB) is supplied to the radio.

This circuit has an overvoltage protection circuit. If a DC voltage of 18 V or higher is applied to the power cable, D39 turns on and a voltage is applied to the base of Q38. This voltage turns Q38 on and turns Q34 and SB off.

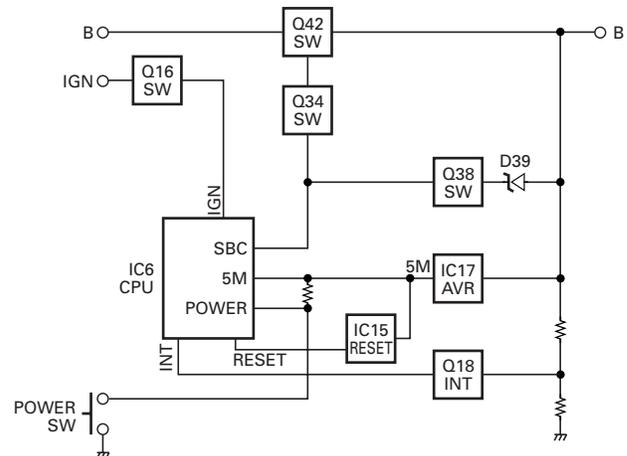

Fig. 16 Power supply circuit

SEMICONDUCTOR DATA

Microprocessor : 784214AGCXXX (TX-RX Unit IC6)

■ Terminal function

PACKING

Parts with the exploded numbers larger than 700 are not supplied.

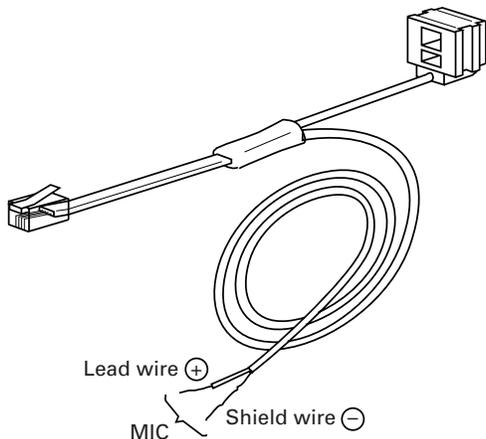

ADJUSTMENT

Test Equipment Required for Alignment

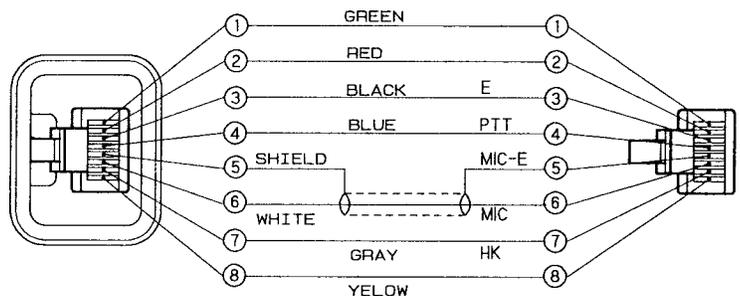

| Test Equipment | Major Specifications | |
|---------------------------------------|--|--|
| 1. Standard Signal Generator (SSG) | Frequency Range Modulation Output | 400 to 520MHz Frequency modulation and external modulation -127dBm/0.1μV to greater than -7dBm/100mV |
| 2. Power Meter | Input Impedance Operation Frequency Measurement Capability | 50Ω 400 to 520MHz or more Vicinity of 100W |
| 3. Deviation Meter | Frequency Range | 400 to 520MHz |
| 4. Digital Volt Meter (DVM) | Measuring Range Accuracy | 1 to 20V DC High input impedance for minimum circuit loading |
| 5. Oscilloscope | | DC through 30MHz |
| 6. High Sensitivity Frequency Counter | Frequency Range Frequency Stability | 10Hz to 1000MHz 0.2ppm or less |
| 7. Ammeter | | 20A |
| 8. AF Volt Meter (AF VTVM) | Frequency Range Voltage Range | 50Hz to 10kHz 1mV to 3V |
| 9. Audio Generator (AG) | Frequency Range Output | 20Hz to 20kHz or more 0 to 1V |
| 10. Distortion Meter | Capability Input Level | 3% or less at 1kHz 50mV to 10Vrms |
| 11. 4Ω Dummy Load | | Approx. 4Ω, 10W or more |
| 12. Regulated Power Supply | | 13.6V, approx. 20A (adjustable from 9 to 17V) Useful if ammeter requipped |
| 13. Spectrum Analyzer | Center frequency | 50KHz to 600MHz |
| 14. Tracking Generator | Output Voltage | 100mV or more |

Tuning cable (E30-3383-05)

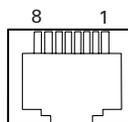

Adapter cable (E30-3383-05) is required for injecting an audio if PC tuning is used. See "PC Mode" section for the connection.

Test cable for microphone input (E30-3360-08)

MIC connector (Front view)

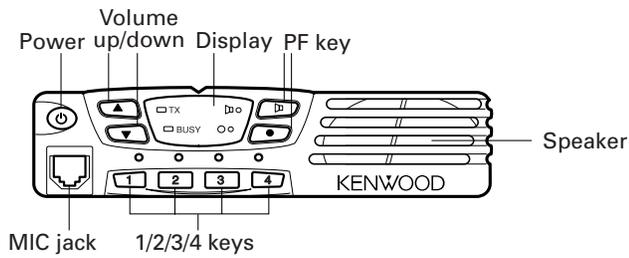

- 1 : BLC
- 2 : PSB
- 3 : E
- 4 : PTT
- 5 : ME

- 7 : HOOK
- 8 : CM

ADJUSTMENT

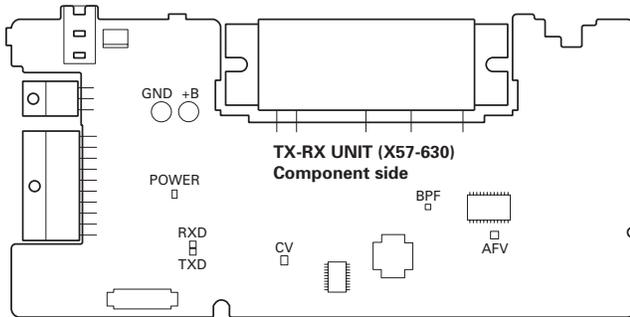

Adjustment Location

■ Switch

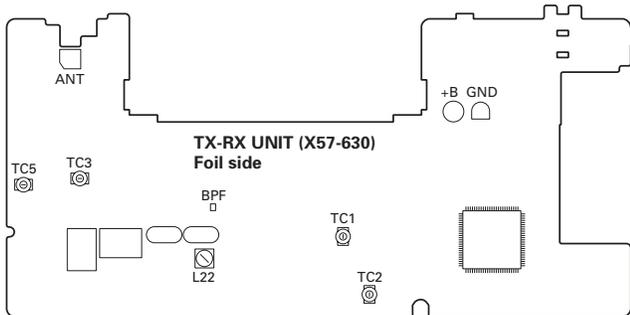

■ Adjustment Point

• Component Side View

• Foil Side View

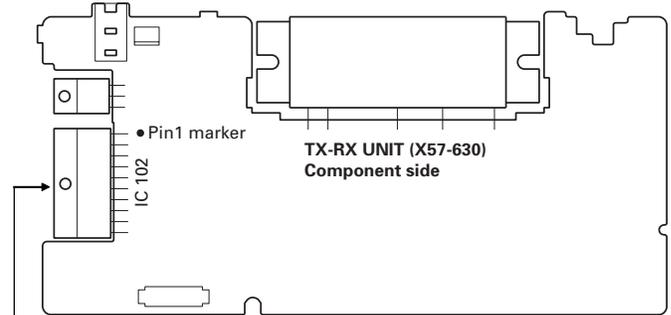

■ Note

• EEPROM

The tuning data (Deviation, Squelch, etc.) for the EEPROM, is stored in memory. When parts are changed, readjust the transceiver.

• AF PA IC (IC102)

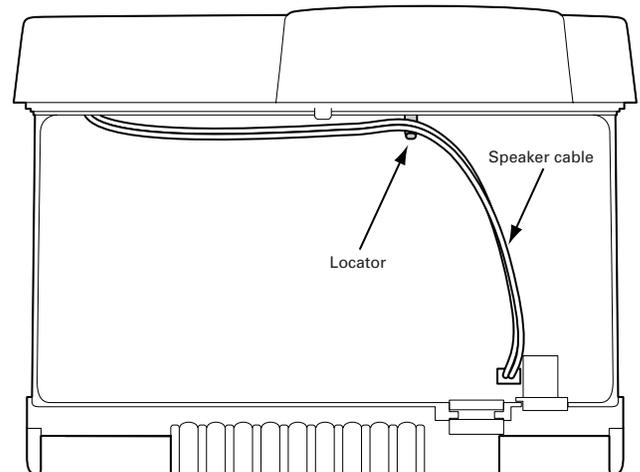

How to mounting the IC102.

Part name label face down.

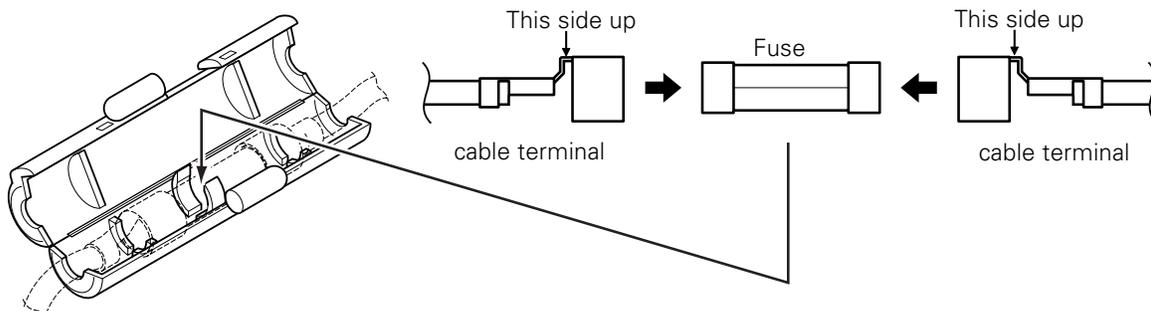

• SPEAKER CABLE

The speaker cable should be formed before mounting the shield cover as below.

• FUSE

To mount the Fuse, the cable terminal direction must be as follows.

ADJUSTMENT

Use KPG-70D programming software for adjustment of the next items.

PCB Section

| Item | Condition | Measurement | | Adjustment | | Specifications/ Remarks |
|------------------------|--|------------------------------------|------------|------------|----------------------------------|----------------------------|
| | | Test equipment | Terminal | Parts | Method | |

| 8 | CM | MIC data detection. |

TK-8102

SPECIFICATIONS

GENERAL

| | |
|-----------------------------------|--|
| Frequency Range | 450 to 490MHz |
| Number of Channels | 4 channels |
| Channel Spacing | Wide : 25kHz Narrow : 12.5kHz |
| PLL Channel Stepping | 5, 6.25kHz |
| Operating Voltage | 13.6V DC \pm 15% |
| Current Drain | Less than 0.4A on standby Less than 1.0A on receive Less than 8.0A on transmit |
| Operating Temperature Range | -30°C to +60°C |
| Dimensions & Weight | 160 (W) x 43 (H) x 107 (D) mm, Approx 1.0kg |
| Channel Frequency Spread | 40MHz |

RECEIVER (Measurements made per EIA standard EIA/TIA-603)

| | |
|--------------------------------|--|
| Sensitivity (12dB SINAD) | Wide : 0.28 μ V Narrow : 0.35 μ V |
| Selectivity | Wide : 75dB Narrow : 65dB |
| Intermodulation | Wide : 70dB Narrow : 60dB |
| Spurious Response | 75dB |
| Audio Power Output | 4.0W |
| Frequency Stability | \pm 2.5ppm |

TRANSMITTER (Measurements made per EIA standard EIA/TIA-603)

| | |
|------------------------------|--------------------------------------|
| RF Power Output | 25W |
| Spurious and Harmonics | 70dB |
| Modulation | Wide : 16K0F3E Narrow : 11K0F3E |
| FM Noise | Wide : 45dB Narrow : 40dB |
| Audio Distortion | Less than 3% |
| Frequency Stability | \pm 2.5ppm |
