ADJUSTMENTS

CASE REMOVAL (See Fig. 1)

1. Release the rod snaps at the bottom of the case.
2. Pull the case out while pushing the external antenna connector.

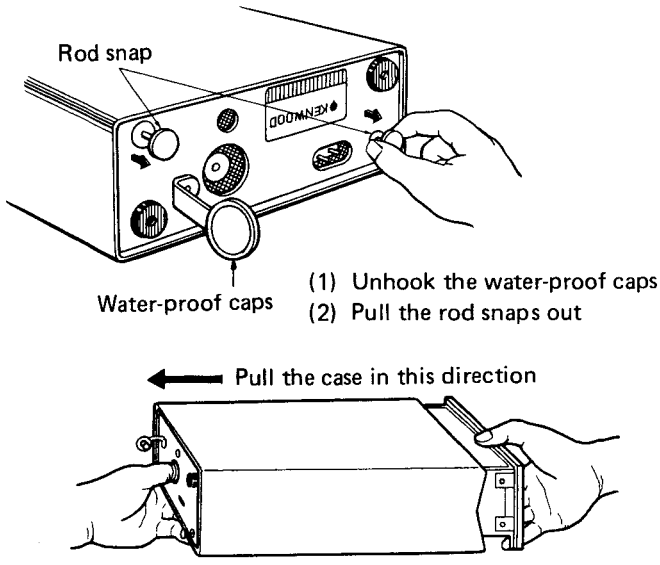

Fig. 1

PRINTED CIRCUIT BOARD REMOVAL (See Fig. 2)

1. Remove the screws securing the printed circuit board (PCB) in place.
2. Slide the PCB sidewise to facilitate its removal.
3. Position the transceiver with the panel toward you and lift the rear end of the PCB.

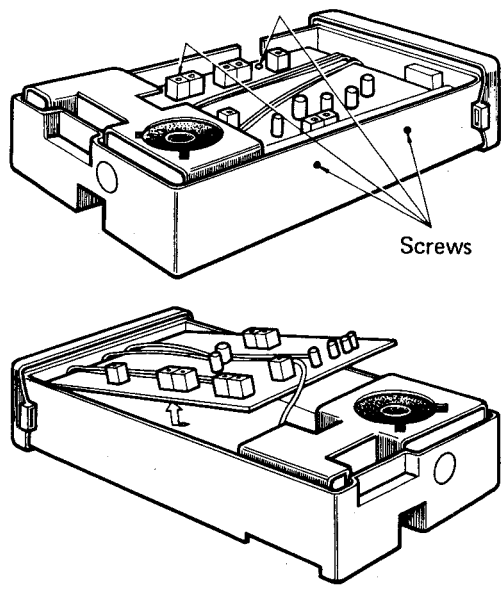

Fig. 2

Note:
To gain access to the TRANSMIT and RECEIVE circuits for repair work, the only part to be removed is the PCB in RECEIVE section: most of the circuits become accessible as you do so. An exception is the multiplier section, which is located behind the speaker: to repair the circuits of this section, disconnect the wires as shown in Fig. 3, remove the PCB securing screws and, as in the removal of RECEIVE section PCB, take out the multiplier PCB.

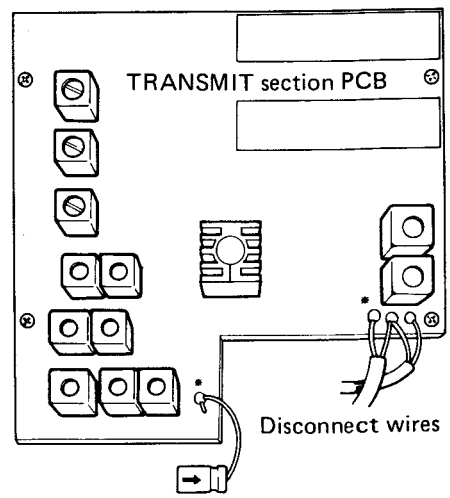

Fig. 3

REPAIRING THE MICROPHONE CONNECTOR

Correct connection of the microphone cord to the connector is shown in Fig. 4.

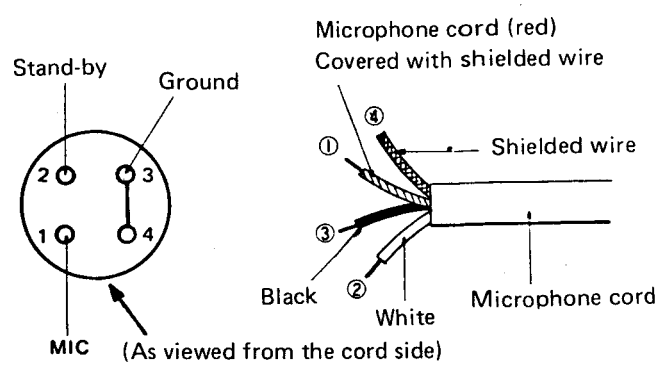

Fig. 4

RECEIVE SECTION ADJUSTMENT

Local Oscillator Coil

1. Tune the transceiver to about 145 MHz.
2. Turn the slug of coil Ls8 clockwise until oscillation stops.
3. Then turn the slug back 360 degrees for stable oscillation.

Sensitivity

1. Connect a signal generator to the external antenna connector.
2. Feed a signal to the transceiver (1 kHz modulation, 7 kHz frequency deviation).
3. Adjust coils Ls1, 2, 4. . . 7, 9, 10 and TCt3 (mounted on the TRANSMIT section PCB) until the meter reads maximum with an optimum S/N ratio.

Discriminator Coil

1. Connect a signal generator to the external antenna connector and an oscilloscope to the output terminal.
2. Apply a signal (1 kHz modulation, 7 kHz frequency deviation, 10 dB ≒3μV output) to the transceiver.
3. Align coils Ls12 and 13 until output waveform is optimum on the oscilloscope.

S-Meter

1. Connect a signal generator to the external antenna connector.
2. Feed a 20 dB signal to the transceiver.
3. Adjust VRs1 until the meter deflects full scale (or reads 10).

Note:

Meter reading below full scale calls for readjustment of sensitivity.

Squelch

Set the channel selector knob to the channel that contains a crystal and confirm that there is no signal received. With any signal not being received adjust VRs2 until squelch opens between 9 and 2 o'clock.

Confirmations

1. The transceiver shall show no large difference in sensitivity for a supply voltage range of 10.4 to 15.2 volts.
2. Sensitivity difference shall be within the specification throughout the entire band including the band edges.
3. The transceiver shall not interfere with TV channel (176 to 182 MHz) after the local oscillator has been aligned.

TRANSMIT SECTION ADJUSTMENT

Note:

Use insulated screwdrivers for coil and trimmer adjustments.

Multiplier and final stage

1. Connect a 50-ohm power meter to the external antenna connector.
2. Set the channel selector of Model TR-2200G to a transmit frequency of 144.15 MHz and connect the instruments as shown in Fig. 5.

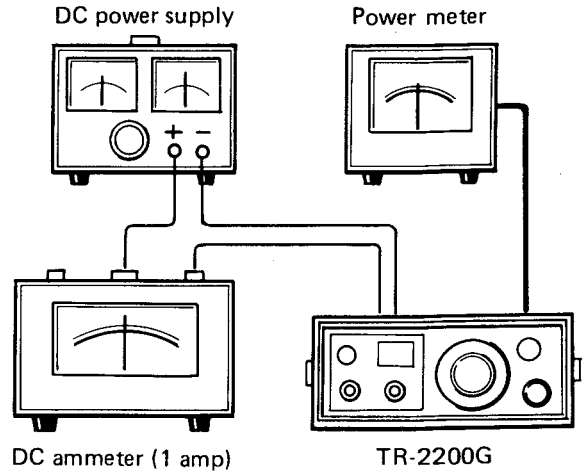

Fig. 5

3. Operate the transceiver in the transmitting state and adjust TCt1, 3 - 10 at a supply voltage of from 9 to 10 volts until the ammeter reads maximum.
4. Increase the supply voltage to 13 volts and adjust TCt1 and 2 for a maximum output.

Note:

TCt2 should be set to a point at which the output is approximately 5% down with a minimum current drain.
This is to be achieved by reducing trimmer capacitance.

Modulation

1. Set the supply voltage to 13 volts and connect an audio generator to the microphone connector.
2. Modulate the carrier with a 1 kHz 5 mV signal and set the transceiver to the transmit state at 144.15 MHz.
3. Observe the waveform on an oscilloscope through a linear detector. Adjust Lt2 until and optimum output is obtained.

Adjustment Without Linear Detector

Apply a 3 mV, 1 kHz signal from the audio generator to the microphone input and connect an audio frequency VTVM to terminal T01 (X56-1080-00). Adjust VRt2 until the meter reads 360 mV. As still another method, another TR-2200G transceiver may be used as monitor.

Maximum Frequency Deviation

1. Connect an audio generator to the microphone connector.
2. Apply 1 kHz signal, 100 mV or greater, to the transceiver.
3. Adjust VRt2 to limit the frequency deviation to 12 kHz maximum.

TRANSMIT FREQUENCY (Fig. 6)

1. Prepare a pick-up coil, put it around the telescopic antenna, and connect its lead to the frequency counter.

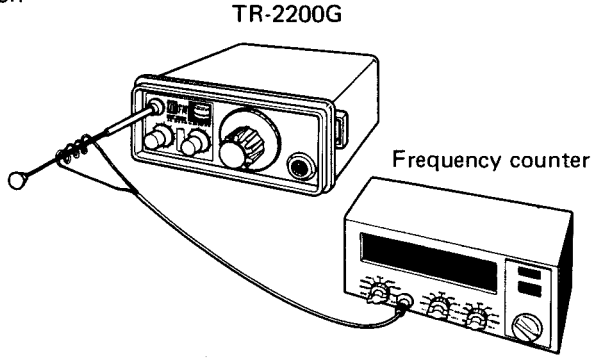

Fig. 6

2. Adjust each channel to the exact TRANSMIT frequency by means of associated frequency adjust trimmer.

Note:

If the available frequency counter dose not measure 144 MHz, connect the counter to the base of Qt4 through a 0.01μF coupling capacitor. This set-up permits the counter to indicate fundamental frequencies. Adjustment tolerance is $\pm$200 Hz.

Each TRANSMIT frequency is related to its fundamental frequency as follows:

CHANNEL	TRANSMIT FREQ. (MHz)	FUNDAMENTAL FREQ. (MHz)
1	144.150	12.012
2	144.200	12.017
3	144.250	12.021

RF Meter

1. Use 13 volt supply voltage.
2. Connect a power meter to the external antenna connector.
3. Adjust VRt3 and/or modify the position of the pick-up lead, located near Lt22, until the meter reads figure 8. (The same applies to the telescopic antenna.)

ADJUSTMENT OF OTHER CIRCUITRY

Battery Check Meter

1. Set the supply voltage to 10 volts.
2. Adjust VRs3 (on the RECEIVE section PCB), until the pointer deflects to between the red and black marks. (Be sure not to allow the screwdriver, used in this adjustment, to come in contact with the chassis and other circuits.)

Charging Circuit (Fig. 7)

1. Turn the transceiver power switch off.
2. Disconnect one of the snaps at the battery holder and measure the current.

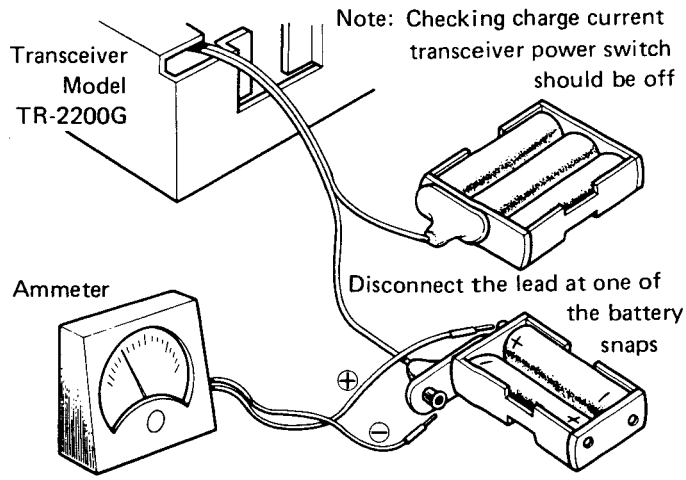

Fig. 7

Note: Charging current vs battery volgage curve for nickelcadmium cells is shown in Fig. 8. The charging current may deviate from this curve depending on the particular transceiver or cells used.

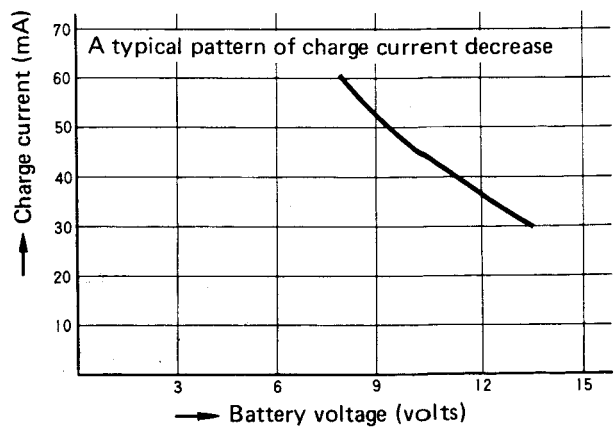

Fig. 8

Insufficient charge current will also result from defective cells. A defective cell or a cell which has an increased internal resistance, if any, can be found by replacing one cell at a time with new one while measuring their charge current. Fig. 9 shows the characteristic of the nickel-cadmium cell.

Cell characteristic

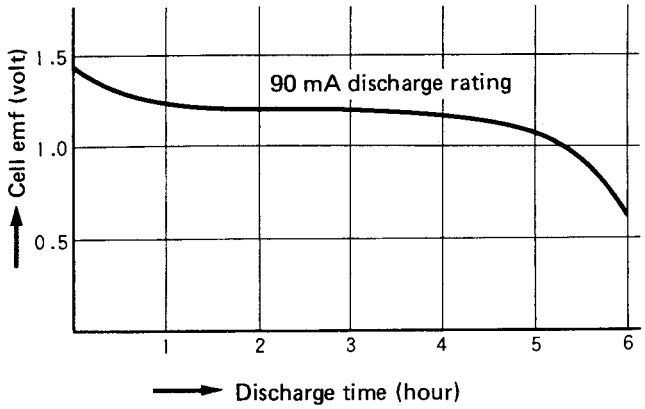

Fig. 9

Confirmations

1. Oral input through the microphone shall be clearly transmitted with sufficient modulation.
2. When the TRANSMIT frequency is varied across the band, there shall be no sign of abnormal oscillation at a supply voltage of from 10.4 to 15.2 volts as monitored by a television set, frequency counter or other devices.
3. The rated RF output shall be available at a standard supply voltage throughout the band.

Note:

Confirmations 1 and 2 should be made with the built-in telescopic antenna.

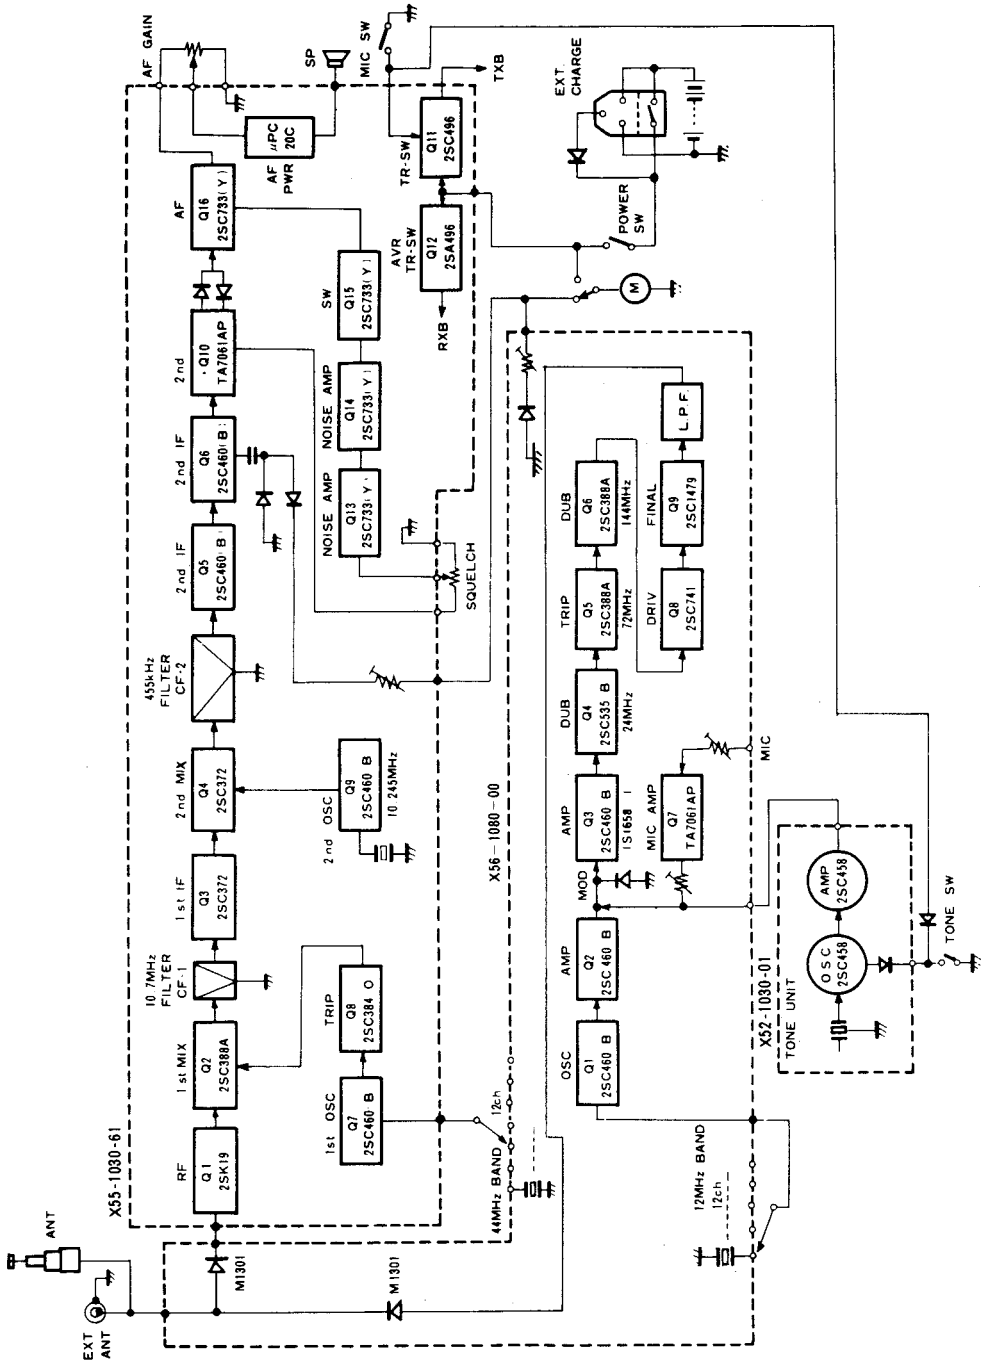
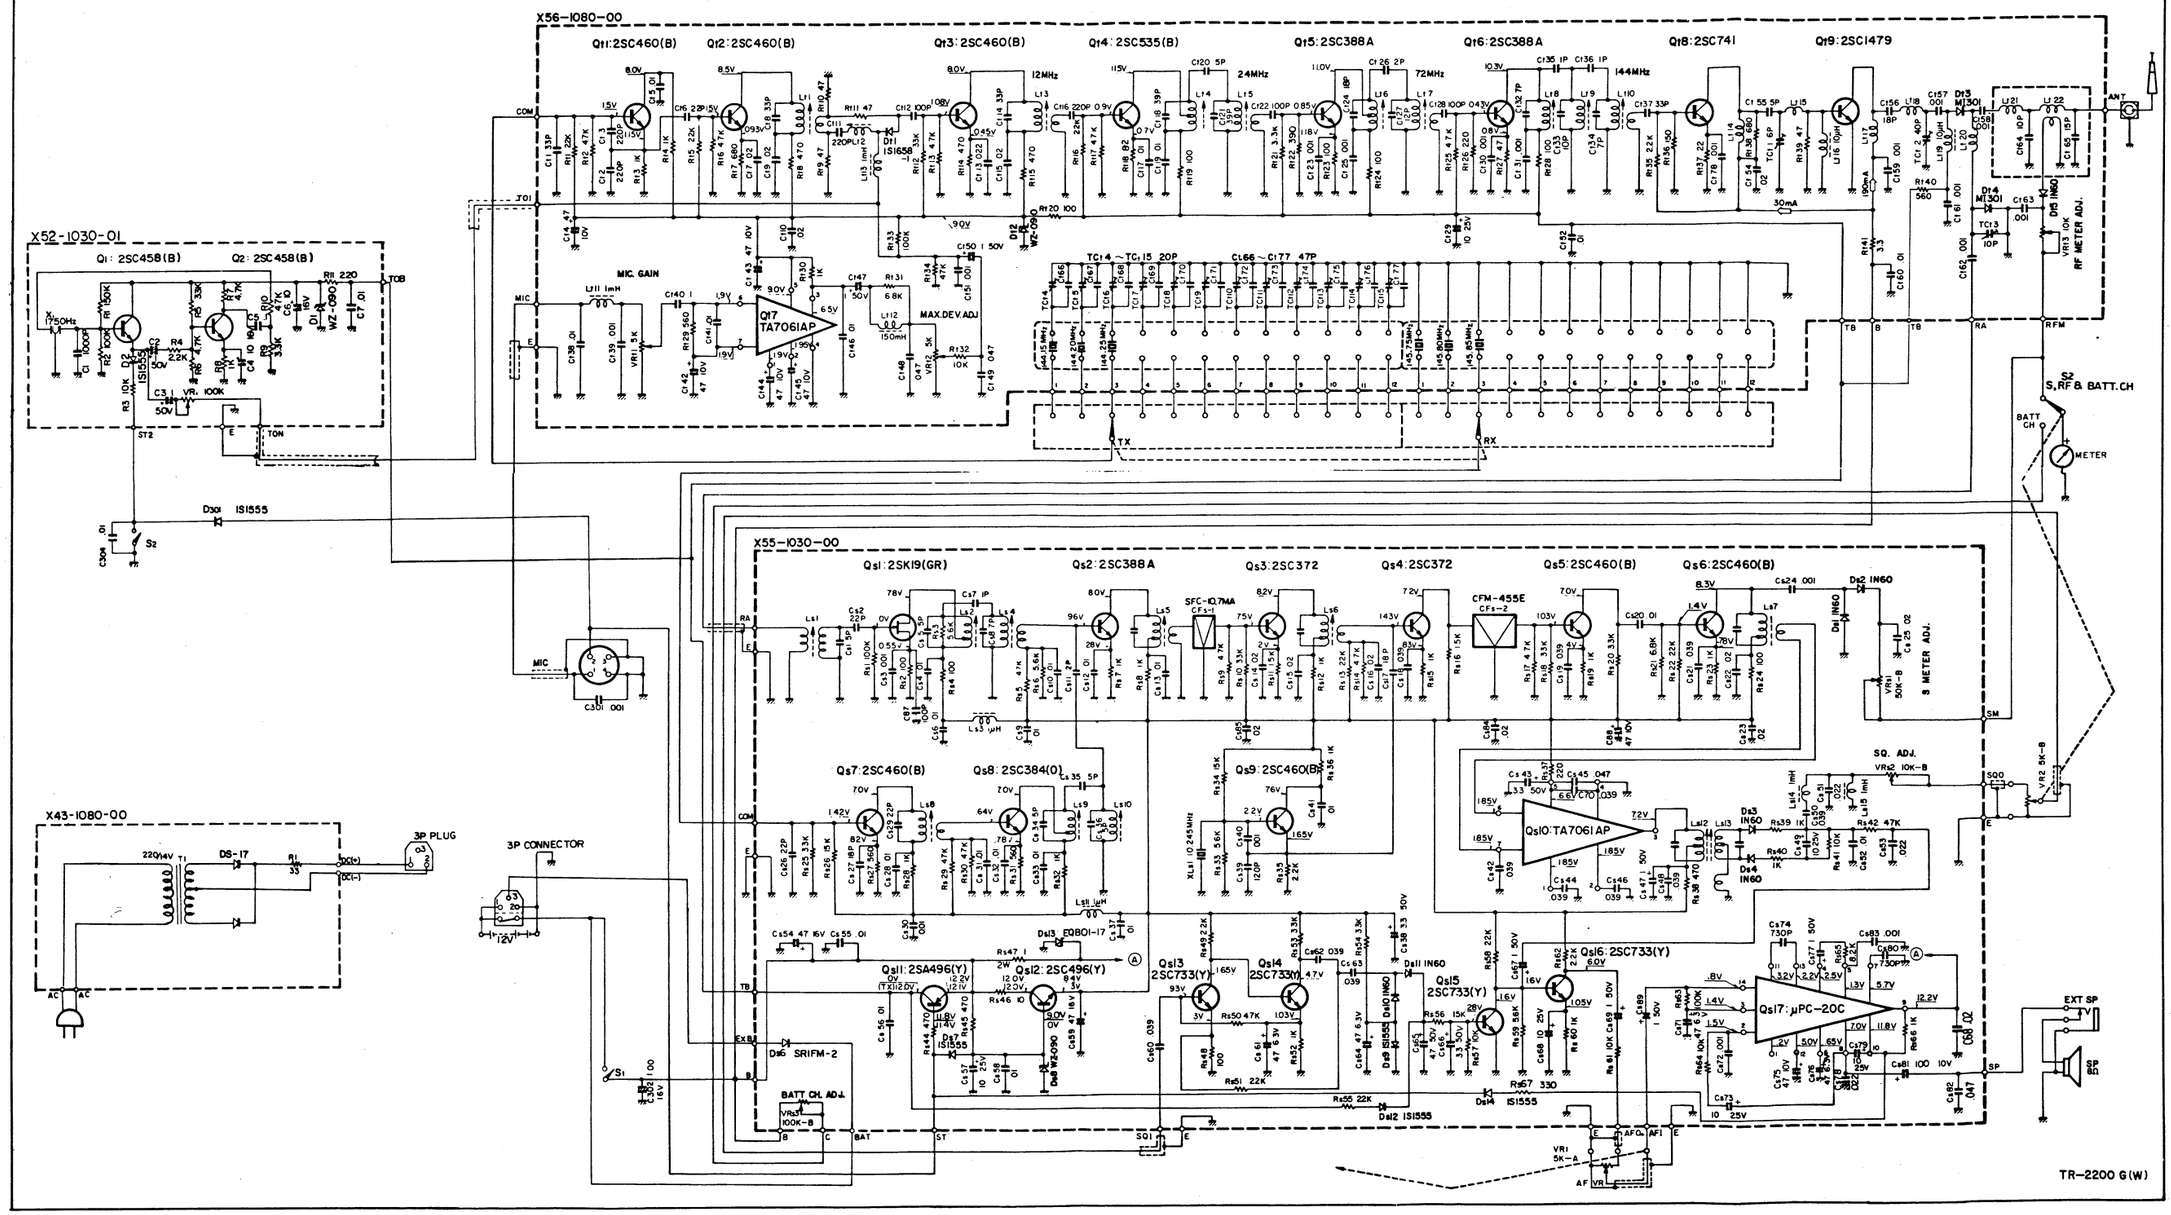
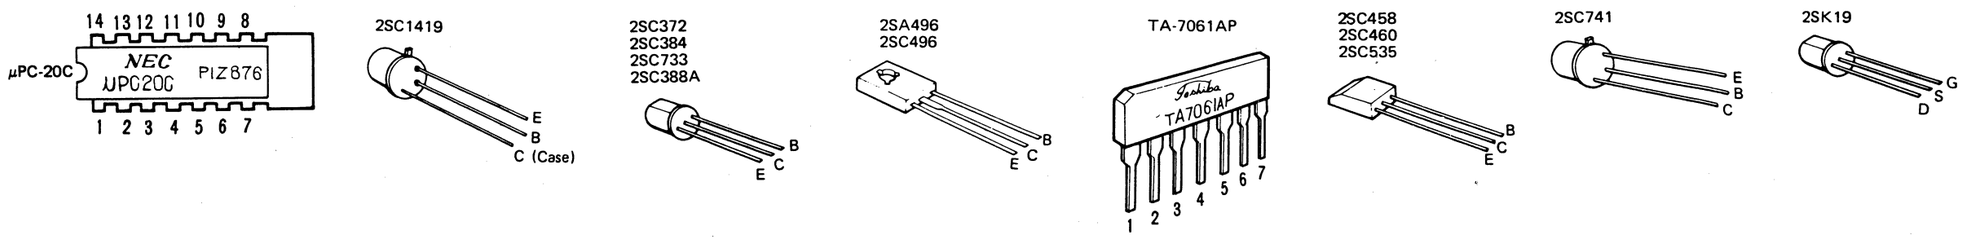
BLOCK DIAGRAM



SCHEMATIC DIAGRAM





SPECIFICATIONS

GENERAL

SOLID-STATE COMPONENTS	
TRANSISTORS	24
FET	1
ICs	3
DIODES	22
POWER SUPPLY	
EXTERNAL	10.4V ~ 15.2V (standard 13V DC)
GROUND	Negative ground
POWER CONSUMPTION	
TRANSMISSION	Approximately 420 mA at 13.0V
RECEPTION	Approximately 55 mA at 13.0V
DIMENSIONS	135mm W x 58mm H x 191mm D
WEIGHT	1.8 kg (including 10 nickel-cadmium cells and microphone)

TRANSMIT SECTION

FREQUENCY	12 channels in 144 to 146 MHz
TYPE OF EMISSION	F3
RF OUTPUT POWER	1.0 watts at 13V DC
MODULATION	Variable reactance phase shift
MAX. FREQ. DEVIATION	± 7.5 kHz
MULTIPLICATION	12 times
FUNDAMENTAL FREQ.	12 MHz band
SPURIOUS RADIATION	Less than 1m watts
ANTENNA IMPEDANCE	50 Ω
MICROPHONE	Dynamic type with PTT switch, 500 Ω

RECEIVE SECTION

FREQUENCY	12 channels in 144 to 146 MHz
TYPE OF EMISSION	F3
CIRCUITRY	Double superheterodyne system
SENSITIVITY	Less than 1 μV for 20 dB S/N
PASS-BAND WIDTH	More than 16 kHz at 6 dB down
SELECTIVITY	Less than 32 kHz at 50 dB down
FILTER	Ceramic filter
INTERMEDIATE FREQ.	1st IF 10.7 MHz
	2nd IF 455 kHz
AUDIO OUTPUT	More than 0.5 watts (10% distortion)
AUDIO OUTPUT (MAX.)	More than 0.7 watts

Note: Circuits and ratings are subjected to modification due to technical improvement.

KENWOOD

Manufactured by TRIO ELECTRONICS, INC., Tokyo, Japan
