CIRCUIT DESCRIPTION

Frequency Configuration

The TS-870S is quadruple conversion in receive mode. As a transmitter, it is quadruple conversion in non-FM modes and double conversion in FM mode.

The fourth 11.3kHz IF signal is converted from analog to digital, connected to the DSP in receive mode, and decoded. In transmit mode, the microphone input signal is converted from analog to digital and applied to the DSP. It is converted from digital to analog, passed through a mixer, and becomes the 455kHz TIF signal. In FM mode, however, only 455kHz carriers are output from the DSP.

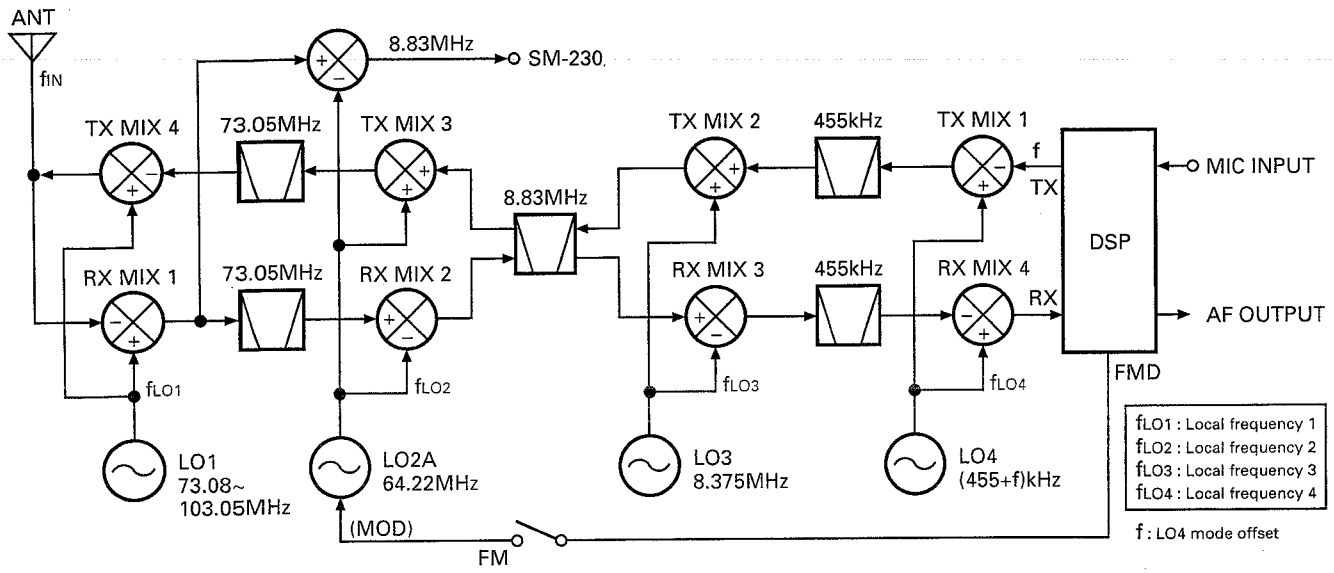

Fig. 1 Frequency configutation

■ Frequency configuration

When the receiver frequency by fIN from the antenna in SSB mode is zero beat (namely, at zero to the SSB signal with a carrier point of fIN), the relationship between these signals is expressed by the following equation.

$$f_{IN} = f_{LO1} - f_{LO2} - f_{LO3} - f_{LO4} + f \quad \ldots . (1)$$

Since all these frequencies are generated by the PLL or DDS circuits as shown in the PLL block diagram in Figure 2, the receiver frequency is determined only by the reference frequency fSTD, the PLL dividing ratio and DDS data. Therefore, the reference frequency accuracy equals the operating frequency accuracy.

The accuracy of the reference oscillator used in the TS-870S is 10ppm (–10 to +50°C). If the temperature-compensated crystal oscillator (TCXO) SO-2 is used, the accuracy becomes 0.5ppm (–10 to +50°C).

The TS-870S local oscillator and CAR DDS are independent of each other. However, they can be operated like a cancel loop configuration by changing the CAR and local oscillator PLL data simultaneously via a microprocessor. This function allows a shift (fLO1, fLO3, fLO4) by the mode change to be performed and the band width of the slope tune to be varied (fLO1, fLO3, fLO4).

When used as a transmitter in SSB mode or in other modes, likewise the frequency is determined by the reference frequency fSTD and dividing ratio. The display frequencies in the modes are listed in Table 1. In the FSK mode, the TS-870S displays the mark transmitter frequency.

CIRCUIT DESCRIPTION

In CW mode, the TS-870S receiving pitch can be changed to the required frequency in 50Hz steps with the desired signal remaining in the center of the IF filter band-pass (Variable CW pitch system). Since the receiving pitch varies along with the transmitter side tone, it is possible to zero-beat by receiving the desired signal at the same pitch as the side tone.

FM transmission is obtained in this system by modulating the f_{LO2} via application of the audio signal from the microphone to the VCO2.

Mode	Display frequency
USB, LSB	Carrier point frequency
CW	Transmission carrier frequency
FSK	Mark transmitter frequency
AM, FM	IF filter center frequency

Table 1 Display frequency in each mode

PLL Circuit

The TS-870S PLL circuit consists of a PLL loop that includes DDS covering a frequency range between 30kHz to 30MHz in 10Hz or 1Hz steps in accordance with the 20kHz reference frequency; DDS that generates other local oscillators (LO3, LO4); and a PLL loop that produces LO2A.

The dividing ratio data to each PLL loop and the DDS data are controlled by a microprocessor. Each loop is controlled by a single crystal frequency control system according to the reference frequency f_{STD}. (See the PLL block diagram in Figure 2.)

■ Reference signal generation circuit

The reference frequency f_{STD} used for frequency control is determined by the 20MHz crystal oscillator (X800 and Q800 : 2SC2714). One reference frequency is output as the reference signal f_{REF} for the PLL and DDS in the PLL section. The other is sent to the TX-RX unit and used as the PLL reference signal for the PLL and DSP.

The crystal oscillator may be replaced by an optional TCXO (SO-2), and the TCXO may be switched to with slide switch S800.

If the optional TCXO (SO-2) is installed, the S800 switch must be set to the SO-2 position.

■ LO2 (PLL section)

Q1 : 2SK508NV in VCO2 (A501 : X58-3390-03) generates 64.22MHz. The 20MHz reference frequency f_{REF} is applied to pin 15 of IC509 : MB86001PF, and is divided internally by a factor of 1000 (4000 in FM mode) to produce a 20kHz (5kHz in FM mode) comparison frequency.

The VCO2 output is applied to pin 6 of IC509 : MB86001PF, and is internally divided by a factor of 3211 (12844 in FM mode). It is compared with the 20kHz (5kHz in FM mode) signal using the phase comparator. The VCO2 frequency is locked. The division ratio is transmitted from the control unit.

The output from PLL2 is passed through buffer Q539, amplified by amplifier Q532, passed through a low-pass filter, its impedance is converted, and is then output to the RF section as LO2A.

■ LO1 (PLL loop)

Four VCOs and uses Q520 to Q523 : 2SK508NV x 4 to generate 73.08MHz to 103.05MHz. The 20MHz reference frequency f_{REF} is applied to pin 15 of PLL IC IC507 : MB86001PF, and is internally divided by a factor of 20 to produce a 1MHz comparison frequency. The output is passed through amplifier Q524, and a band-pass filter. One output is passed through buffer Q526 : 2SC2996 and a low-pass filter and goes to the RF section.

The other output signal is passed through buffer Q525 : 2SC2714 and applied to pin 5 of mixer IC508 : SN76514. A signal of 54.54 to 55.54MHz is input to pin 11 of IC508 and converted to a signal of 18.0 to 48.0MHz. This signal is output from pin 13. The signal is passed through a high-pass filter, a low-pass filter, and amplifier Q531 : 2SC2714 and Q530 : 2SC2712, and goes to pin 6 of PLL IC IC507 : MB86001PF.

This signal is internally divided by N, and compared with the 1MHz signal using the phase comparator. The mixer output frequency is locked in 1MHz steps. The division ratio N is transmitted from the control unit as data (N : 18 to 48) corresponding to 0MHz to 30MHz in 1MHz steps. One of the four VCOs is selected according to the VCO change signal (VB0 to VB3) sent from the control unit.

CIRCUIT DESCRIPTION

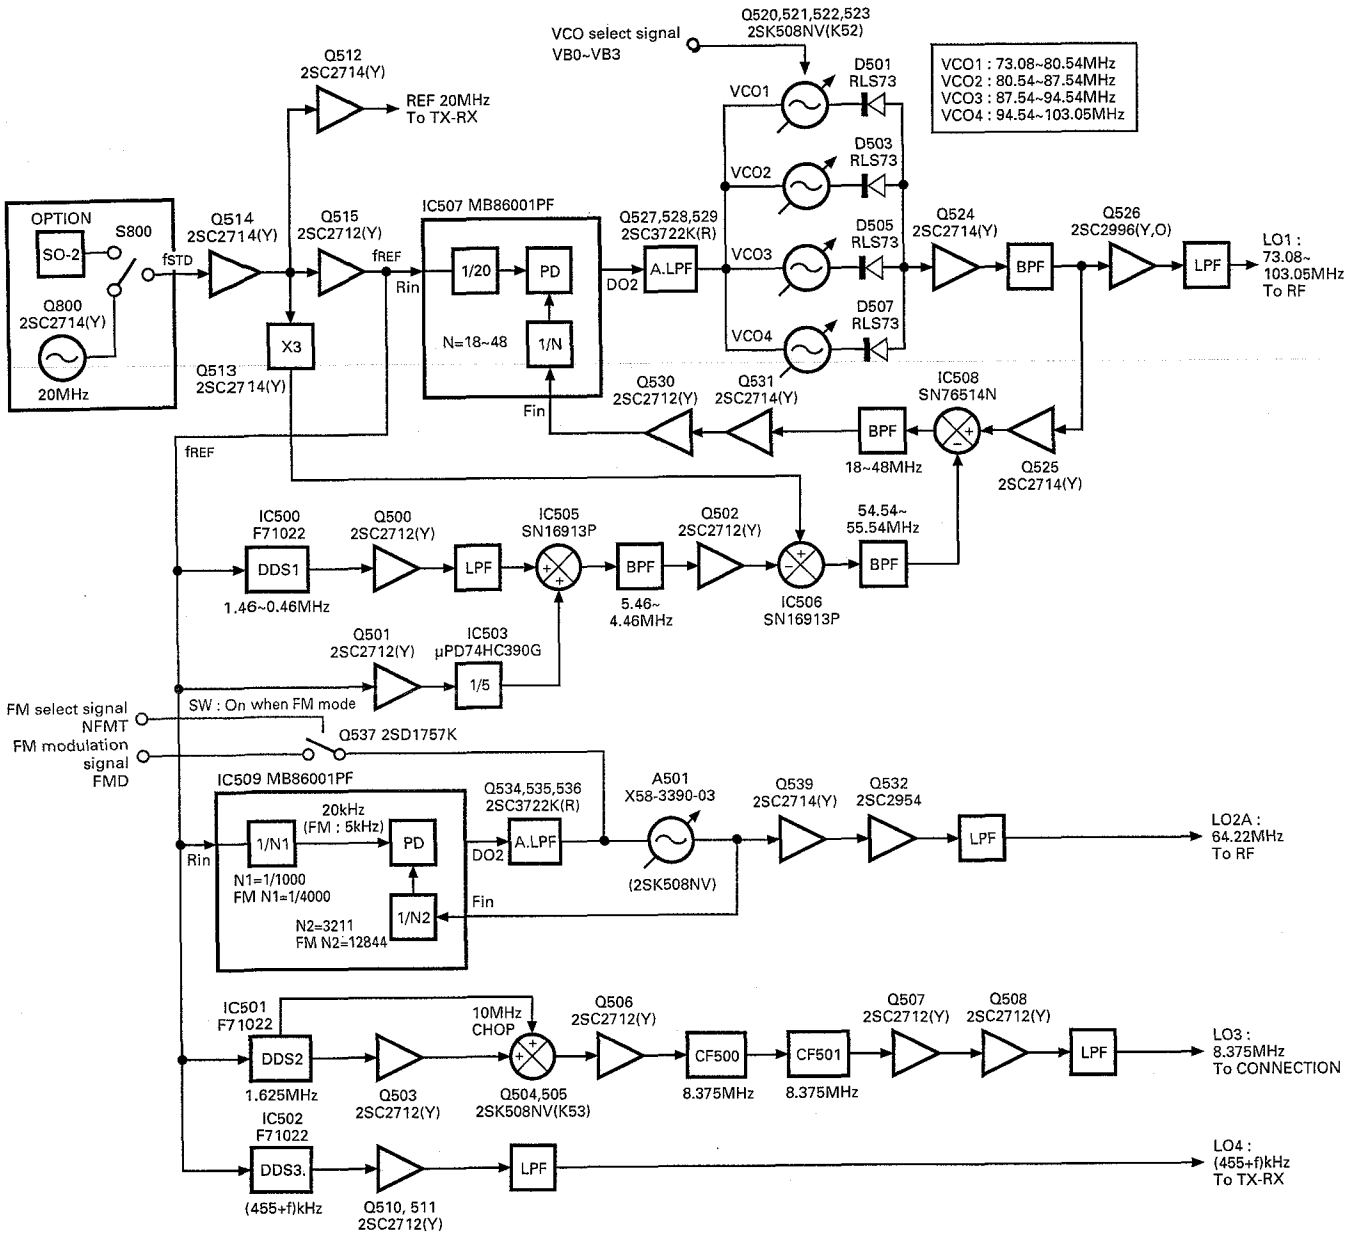

Fig. 2 PLL block diagram

CIRCUIT DESCRIPTION

DDS1 (IC500 : F71022) generates 1.46 to 0.46MHz digital signals. They are converted to analog signals by a digital to analog converter (consisting of CP500, CP501, and Q500), passed through a low-pass filter, and fed to pin 5 of mixer IC505 : SN16913P. The 4MHz signal produced by division of 20MHz reference frequency fREF by divider IC503 : UPD74HC390G by a factor of 5 is input to pin 2 of the mixer IC505, and a 5.46 to 4.46MHz signal is output from pin 1. The output signal is passed through a band-pass filter and buffer Q502, and input to pin 5 of mixer IC506 : SN16913P. The 60MHz signal obtained by tripling 20MHz reference frequency fREF via multiplying circuit Q515 is mixed, and a 54.54 to 55.54MHz signal is output. This signal is passed through a band-pass filter, and goes to pin 13 of mixer IC508.

DDS1 sweeps the 1.46 to 0.46MHz digital signal output in 10 or 1Hz steps, and LO1 covers the 73.08 to 103.05MHz signal in 10 or 1Hz steps and is output to the RF section.

■ LO3 generation

DDS2 (IC501 : F71022) generates a digital signal of the 1.625MHz basic frequency. It is converted to an analog signal by a digital-to-analog converter (consisting of CP502, CP503, and Q503), and chopped by a circuit consisting of Q503 to Q505 so as to extract an 8.375MHz primary harmonic component. Unwanted components are removed by a ceramic filter consisting of CF500 and CF501. The resulting signal is passed through amplifier Q507, buffer Q508, and a low-pass filter, and output to the connection section (final unit) as the LO3 signal.

■ LO4 generation

DDS3 (IC502 : F71022) generates a (455+f) kHz digital signal. It is converted to an analog signal by a digital to analog converter (consisting of CP504, CP505, and Q510), passed through buffer Q511 and a low-pass filter, and output to the TX-RX unit as the LO4 signal.

The LO4 signal is a local oscillator signal used to generate a DSP processing signal f from 455kHz. The f frequency is described in the local signal section (page 14).

■ Subtone generation

During FM transmission, the DSP generates a signal to which a subtone is added and is then sent to the main unit as it is.

■ PLL data

The TS-870S has three PLLs to which the main CPU sends PLL data based on the displayed frequency.

- PLL comprising a VFO (PLL section)
- Local oscillator PLL for frequency conversion (PLL section)
- PLL that generates timing clocks for digital signal processing (TX-RX unit)

The VCOs change with the following conditions.

- Main encoder change → VCO1 (PLL section)
- Mode change → VCO2 (PLL section)

Each PLL IC outputs an unlock signal. If any PLL is unlocked, the main display indicates "....." (dots). If the unlocked PLL is the TX-RX unit, the sub-display shows "Err-FD", and if it is the PLL unit, it shows "Err-FE" to indicate that it is unlocked.

The unlocking of each PLL is output to pin 11 (UL) of PLL IC : MB86001PF as unlock data (UNLOCK : LOW).

Loop	VCO No.	IC No.	Comparison frequency/divide ratio	Variable divide ratio	Frequency (MHz)
LO1	VCO1	IC507	1MHz/20	18~48	73.08~103.05
LO2	VCO2	IC509	20kHz/1000 5kHz/4000 : FM	3211 12844 : FM	64.22

CIRCUIT DESCRIPTION

■ DDS circuit configuration

The DDS IC has been developed with standard cells to implement a high-speed operation circuit and large-capacity ROM at a low cost.

1) IC configuration

The IC consists of the following components:

Two 28 bit registers for setting frequency data, one 28 bit frequency shift register for addition to the frequency register, a 23 bit parallel signal input section for frequency modulation with a parallel signal, and a data entry and selection section.

Frequency modulation section comprised of a 28 bit adder that adds frequency data and frequency modulation data

Phase data operation section that adds data from the frequency modulation section with the 28 bit phase data register

SIN-ROM that converts phase data to sine data.

2) Frequency/shift data setting

Using serial signals synchronized with clock pulses, a total of 30 bits (2 bits that specify the destination to which data are set and 28 bits for frequency data) are set in three internal registers.

3) Frequency register selection

The data set in the two frequency registers are selected by the SLAB input of the DDS IC. This pin handles the TXC signal. This function eliminates the need for the TS-870S microprocessor to set frequency data for each transmission and reception.

4) Frequency data selection

The SPSL input of the DDS IC selects whether to use the data in the internal frequency shift register or the data from parallel input as frequency modulation data.

5) Frequency modulation

The MDEN input of the DDS IC enables or disables frequency modulation. When frequency modulation is enabled, frequency data is added, and the result is input to the phase data operation section.

6) Phase data operation

The target frequency phase data is output by accumulating 28 bit frequency data in the 28 bit phase accumulator.

$Fout = Fs/2^{28} \cdot Dsum$

Fs : DDS IC input frequency/2

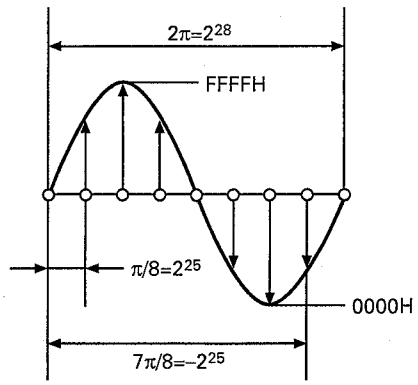
Dsum : Frequency data+Frequency modulation data

If 2^{25} is set for Dsum when 1/8 Fs is output, the phase data must be increased by $\pi/8$.

A 28 bit absolute value operation has been used here, but a 28 bit signed operation can also be used, assuming that the MSB is a sign. If complement data of 8000000 to FFFFFFFF (hex) is set, the phase moves in the negative direction for the positive data.

7) SIN-ROM

Phase data from the phase data operation section is converted to sine data of 0000 to FFFF (hex) in the 16 bit offset binary format.



CIRCUIT DESCRIPTION

Receiver Circuit

The basic configuration of the receiver circuit is quadruple conversion. After the frequency is converted to the 11.3kHz fourth IF, the DSP carries out AGC, filtering, detection, and signal processing. Figure 3 is a receiver block diagram.

The signal coming from the antenna connector is passed through the antenna switching relay (K301) in the final unit (E/5 relay section), the antenna tuner unit, and the transmit/receive changeover relay (K302) within the relay section, and then goes to the CN2 (RAT) of the RF unit (A/9 RF section).

The signal input to the RF unit is passed through protection lamp PL1 for strong signal input, external receiver power distribution circuit L1 and L2 and switching circuit K1, and is input to the ATT (–6dB, –12dB) circuit. This distribution circuit is switched when the EXT RX (function that distributes the signals from the antenna to the external receiver), which is set from menu No.53, is turned ON. When this function is ON, the signal from the antenna is attenuated by about 4dB and output to the receiver section in the subsequent stage and the EXT RX terminal on the rear. The signal to the EXT RX terminal is passed through lamp PL2 for protection during transmission. The lamp turns OFF when about 10W is input.

The signal is passed through the ATT switching circuit, then goes to the BC band attenuation circuit (L7 to L9, C19 to C22). The BC band signal is attenuated by 5 to 10dB to prevent power saturation of the band-pass filter switching diode resulting from interference from a proximate station. The band-pass filter consists of two low-pass filters and 10 band-pass filters, and passes signals during transmission. The pin diode (1SV128) is used to change the input to raise the signal saturation level when a HIGH signal is input.

The RF amplifier circuit functions as a low-gain amplifier using Q14 and Q15 : 2SK2218(5) x 2 when the frequency is 21.49MHz or lower, and it functions as a high-gain amplifier using Q13 : 3SK131(M) when the frequency is higher than 21.49MHz. It is bypassed when AIP is ON.

The 73.05MHz first IF signal is generated by quad mixer Q17 to Q20 : 2SK520(K44) x 4. It is passed through XF1 73.05MHz MCF, Q24 : 3SK131(M) first mixer amplifier, and Q26 and Q27 : 2SK520(K43) mixer to produce a 8.83MHz second IF signal. The second IF signal is divided into two signals, one of which is branched to the noise blanker, amplified by amplifier Q28, and then goes to the NB circuit. The other signal is input to the second IF signal amplifier, and serves as a blanking gate by the NB and RBK signals. The amplified second IF signal is passed through the 8.83MHz IF filter, and output to the final unit (C/5 connection section) from CN10. This signal is switched with the diode switch D62 and D68, and functions as a second IF signal output during reception and a third IF signal input during transmission.

The second IF signal input to CN412 in the final unit (C/5 connection section) is routed to the receiver circuit by D450, and input to the mixer Q460 and Q461 to generate a 455kHz third IF signal. It is passed through the 455kHz IF filter, amplified by third IF amplifier Q475, and output by CN411 to the TX-RX unit as RIF signal. The total gain of the receiver unit is adjusted by VR1 in the TX-RX unit.

CIRCUIT DESCRIPTION

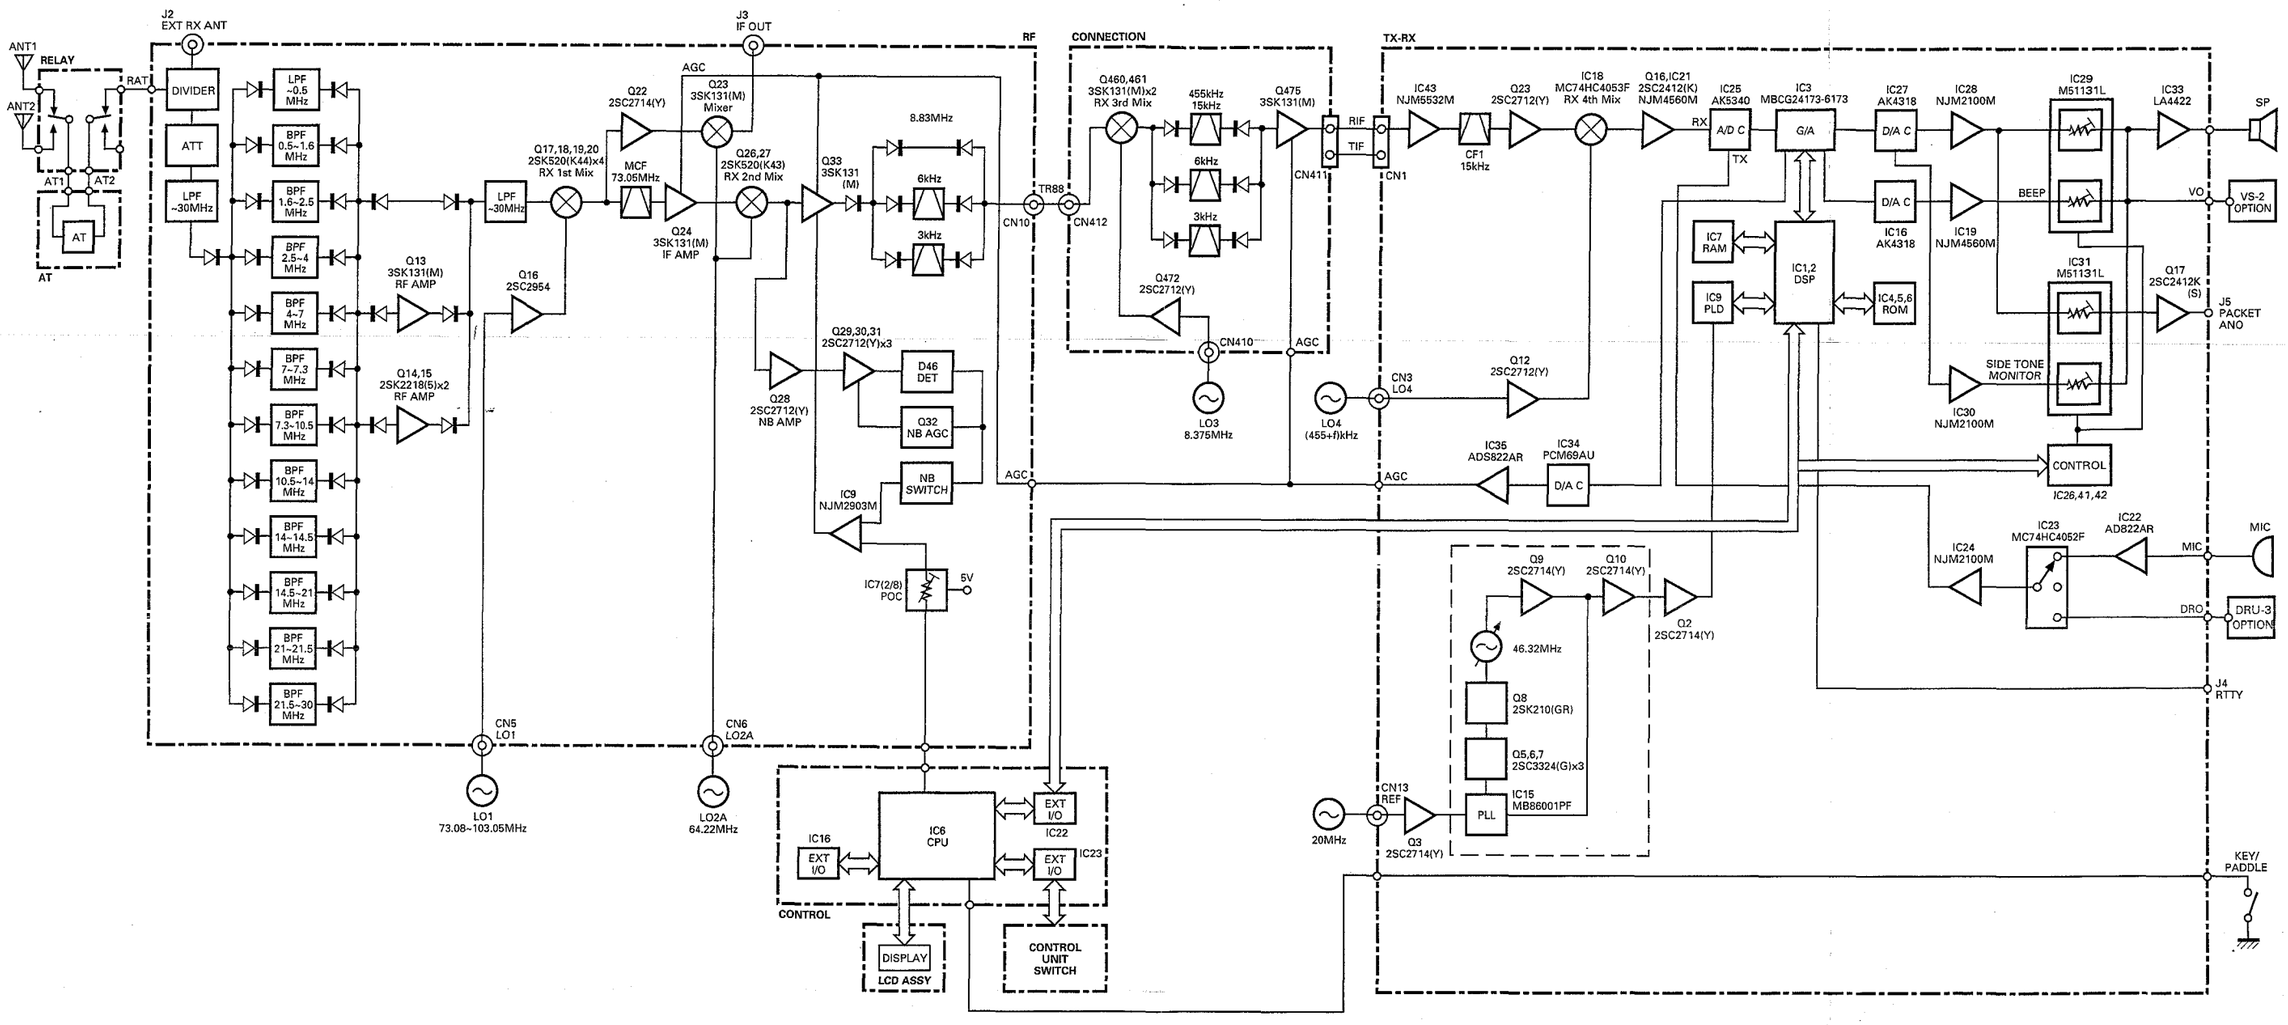


Fig. 3 Receiver block diagram

CIRCUIT DESCRIPTION

■ IF filter

The IF filter consists of a DSP digital filter. If there is a HIGH signal outside the DSP filter band, the analog to digital converter input level may be saturated, and the filter does not work properly. Thus, an analog filter is inserted between the second IF (8.83MHz) and the third IF (455kHz) so that it does not impair the DSP filter properties. To operate each filter properly, there are three kinds of filters for each IF signal and also slope tuning is carried out.

1) Filters characteristics

Item	Rating
Nominal center frequency	73.05MHz
Pass bandwidth	±7.5kHz or more at 3dB
Attenuation bandwidth	±30kHz or less at 40dB
Ripple	1.0dB or less
Insertion loss	3.0dB or less
Guaranteed attenuation	70dB or more at fo + (500 to 1000kHz) 70dB or more at fo – (200 to 1000kHz)
Center frequency deviation	Within ±1.5kHz at 3dB
Terminating impedance	2kΩ ± 10%

MCF (L71-0401-05) : RF unit XF1

Item	Rating
Nominal center frequency	8830kHz
Center frequency deviation	Within ±150Hz at 6dB
Pass bandwidth	±1.5kHz or more at 6dB
Attenuation bandwidth	±1.9kHz or less at 20dB ±2.75kHz or less at 60dB ±3.5kHz or less at 80dB
Ripple	2dB or less
Insertion loss	6dB or less
Guaranteed attenuation	80dB or more in the range ±3.5kHz to ±1MHz
Terminating impedance	600Ω / 15pF

MCF (L71-0235-05) : RF unit XF2

Item	Rating
Nominal center frequency	8830kHz
Pass bandwidth	±3.0kHz or more at 6dB
Attenuation bandwidth	±16.0kHz or less at 60dB ±13.0kHz or less at 50dB
Guaranteed attenuation	70dB or more with in fo ± 1MHz (Without spurious in the range fo to fo+500kHz)
Ripple	Within 1.0dB
Insertion loss	Within 1.5dB
Terminating impedance	1850kΩ / 2pF

MCF (L71-0266-05) : RF unit XF3

Item	Rating
Nominal center frequency	8.400MHz
3dB attenuation bandwidth	Within 180 ± 40kHz
20dB attenuation bandwidth	400kHz or less
Insertion loss	9.0dB or less Formula : 20 x log [E1÷ (2 x E2)]
Ripple	1.0dB or less (within 3dB band)
Spurious attenuation	25dB or more (6.0 to 10.0MHz)
Voltage capacity	50V DC (1 minute)
Insulating resistance	100MΩ or more (100V DC)
Input and output impedance	330Ω

Ceramic filter (L72-0343-05) : RF unit CF500, 501

Item	Rating
Nominal center frequency	455kHz
6dB bandwidth	±3kHz (455kHz)
50dB bandwidth	±9kHz (455kHz)
Ripple	2dB or less (within 455+2kHz)
Insertion loss	6dB or less
Guaranteed attenuation	60dB or more (within 455±100kHz)
Input and output impedance	2.0kΩ

Ceramic filter (L72-0319-05) : Final unit CF451

Item	Rating
Center frequency	455±0.20kHz
6dB bandwidth	2.9 to 3.2kHz
60dB bandwidth	4.7kHz or less
Guaranteed attenuation	60dB or more at 0.1 to 1MHz
Spurious	40dB or more at 600 to 700kHz
6dB band ripple	2dB or less
Insertion loss	6dB or less
Input and output impedance	2kΩ

Ceramic filter (L72-0333-05) : Final unit CF452

Item	Rating
Nominal center frequency	455kHz
6dB bandwidth	±7.5kHz or more (455kHz)
50dB bandwidth	±15kHz or less (455kHz)
Ripple	3dB or less (within 455+5kHz)
Insertion loss	6dB or less
Guaranteed attenuation	35dB or more (within 455±100kHz)
Input and output impedance	1.5kΩ

Ceramic filter (L72-0366-05) : Final unit CF453

TS-870S

CIRCUIT DESCRIPTION

■ IF gain correction

The total gain changes when the AIP is turned ON or OFF or the band is 21.49MHz or higher. To limit the changes, the DSP corrects the IF gain. Table 2 lists the corrections. When the "AIP S-meter correction" on menu No.11 is turned ON, the S-meter is corrected when the AIP is turned ON. And since the IF gain is corrected greatly, the receiver internal noise output becomes large.

Frequency	Correction (dB) AIP OFF	Correction (dB) AIP ON1 (Menu 11 OFF)	Correction (dB) AIP ON2 (Menu 11 ON) SSB, CW, FSK only	Pre-amp gain (dB) reference
30kHz~ 21.49MHz	–2	0	+12	15
21.49MHz~ 30.MHz	–7	0	+12	21

Table 2 IF gain corrections

■ NB circuit

The noise blanker, like the conventional one, branches the signal before the narrow-band filter of the 8.83MHz second IF, and detects noise, and performs blanking using the second IF amplifier as a gate. The signal is amplified by Q28, detected by the AGC amplification and noise detection circuit consisting of Q29 to Q32 and D46, and then a blanking pulse is generated by the IC9 comparator. The noise detection circuit Q29 to Q32 and D46 is separated into segments by a jumper in the unit to prevent sneak path.

■ Slope tune

The operating principle of SSB-SLOPE-TUNE is explained first. When f_{LO1}, f_{LO3}, and f_{LO4} in Figure 4 are at their normal frequencies, the synthesized bandwidth is indicated by A. If the f_{LO1} frequency is increased by $\Delta f1$ and the f_{LO3} frequency is decreased by $\Delta f1$, the filter of the 8.83MHz band shifts to position B. The synthesized bandwidth is indicated by the section overlapped by A and B. When the frequencies of f_{LO1} and f_{LO3} are lowered by $\Delta f2$, only the 455kHz second IF filter shifts to position C. The synthesized bandwidth is indicated by the section overlapped by B and C.

Therefore, high frequencies are cut off by increasing the f_{LO1} frequency and decreasing the f_{LO3} frequency. Low frequencies are cut off by decreasing the f_{LO3} and f_{LO4} frequencies. The TS-870S enables these operations using the DSP filter.

In SSB mode, slope tune high cut/low cut is switched by using the filter select control : in CW mode, the WIDTH (bandwidth)/SHIFT (center frequency) is changed, and in FSK mode, the WIDTH (bandwidth) is changed. The microcomputer in the control unit sends filter select data to the DSP, and slope tuning is carried out by changing frequency data given to the PLL and DDS. The second IF (8.83MHz) and third IF (455kHz) filters are selected to carry out slope tuning effectively. Tables 3 and 4 list filter selections, slope tuning and analog filter high cut/low cut amounts. Slope tuning low cut/high cut can be switched in AM mode, and the WIDTH can be switched in FM mode by using DSP filters only, and the analog filter is fixed to 15kHz.

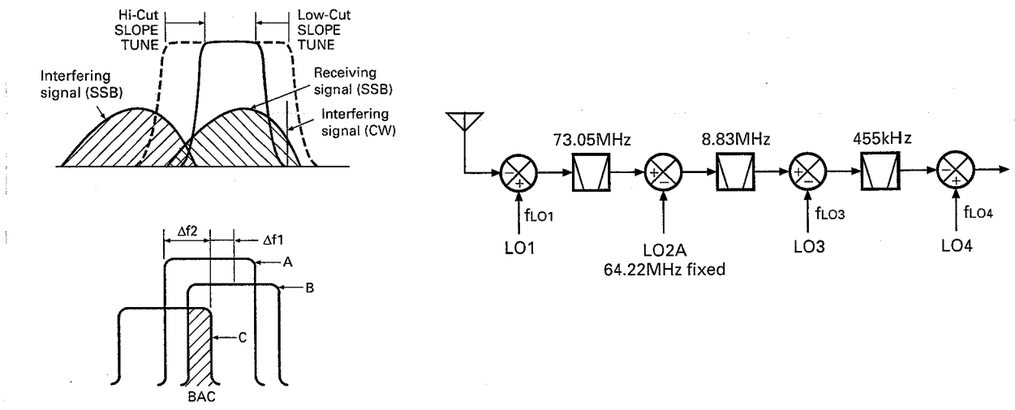

Fig. 4 SSB slope tune operating principle

Table 4-2 CW WIDTH/SHIFT high cut amount (Hz)

CIRCUIT DESCRIPTION

■ Local signals (LO1, LO3, LO4)

1) LO1

Table 5 lists LO1 frequency configuration.

DDS1 varies from 0.46 to 1.46MHz, and when the display frequency is multiple MHz (for example, 14.000MHz), 0.96MHz is output. When the display frequency is increased, the DDS1 frequency is reduced by the amount of change. When the DDS1 frequency is reduced to 0.46MHz, the frequency is switched to 1.46MHz, and when it is increased to 1MHz, the frequency returns to 0.96MHz (Figure 5). By changing the 1MHz band in synchronization with the display frequency, the 1MHz comparison PLL circuit is locked and LO1 is generated.

In Table 5, the 0.96MHz base indicates the DDS output when the frequency is multiple MHz. The frequency (UNV) indicates the decimal digits of the MHz frequency. (If the display frequency is 14.2MHz, (UNV) = 0.2MHz.) DDS is switched by 500kHz, so – 0.5MHz ≤ (UNV) < 0.5MHz.

As described in the slope tuning section, slope tuning high-cutting is corrected for LO1, so the correction is added to the DDS output. SSB H in Table 5 indicates the correction. Table 3 shows the actual correction of SSB H. (For example, when the high frequency is 2.2kHz, the correction SSB H is 0.2kHz.)

Since RIT and XIT change the receive and transmit frequencies by the preset amount, it needs to be corrected. They are D RIT and D XIT in Table 5.

The "8.83MHz window-joining" (D 883) in Table 5 is determined during adjustment. For example, the equation for calculating the DDS output frequency for 14.2MHz USB. The high-cut frequency is assumed to be 2.6kHz. (D 833 is zero.)

DDS1 : 0.96M – (UNV) – (OFS SSB) + (SSB H)
= 0.96M – 0.2M – 1.2k – 0.2k
= 758.6kHz
0.96M : Base
UNV : 14.2M – 14.0M = 0.2M
OFS SSB (Filter offset) : 1.2k
SSB H (Slope HI) : –0.2k (See table 3.)

The LO1 output frequency f_{LO1} is calculated from the frequency configuration in Figure 6.

$f_{LO1} = f_{PLL\ IN} + 60MHz - (4MHz + f_{DDS1})$
$= 32MHz + 60MHz - (4MHz + 758.6kHz)$
$= 87.2414MHz$

Where $f_{PLL\ IN}$ is the PLL input frequency and f_{DDS1} is the DDS1 output frequency.

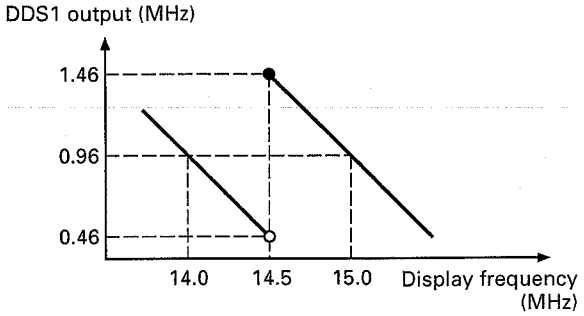

Fig. 5 Relationship between display frequency and DDS output frequency

2) LO3

Table 6 lists the LO3 frequency configuration.

The LO3 frequency is 8.375MHz, and is generated by the chopper circuit. The DDS2 output frequency is 1.625MHz. For LO3, slope tuning low-cut/high-cut is corrected. SSB H and SSB L in Table 6 indicate the corrections. D 833 and D 455 are values determined during filter window-joining and adjustment.

For example, if USB is 14.2MHz, high-cut frequency is 2.6kHz, and low-cut frequency is 300Hz, the LO3 frequency is calculated as follows. It is assumed that D 833 and D 455 are zero.

$f_{LO3} = 1.625MHz + (SSB\ H) + (SSB\ L)$
$= 1.625MHz + (-0.2kHz) + 300Hz$
$= 1625.1kHz$

CIRCUIT DESCRIPTION

3) LO4

Table 7 lists the LO4 frequency configuration.

For LO4, correction (OFS SSB) is carried out so that a signal passes through a filter according to the mode, and the slope tune low-cut (SSB L) is corrected. The mode offset is the frequency (11.30859375kHz) used for processing by the DSP, and its sign changes with the mode.

For example, if USB is 14.2MHz and the low-cut frequency is 300Hz, the LO4 output frequency is calculated as follows.

f_{LO4} = 455kHz + (mode offset) + (OFS SSB) + (SSB L)
= 455kHz + 11.30859375kHz + 300Hz
= 467.8085938kHz

The filter is corrected according to each mode by LO1 and LO4, slope tuning high-cut is corrected by LO1 and LO3, and low-cut is corrected by LO3 and LO4.

In other modes, each local frequency is determined by the calculation method as shown previously in Tables 5 to 7.

Table 7 LO4 frequency configuration

CIRCUIT DESCRIPTION

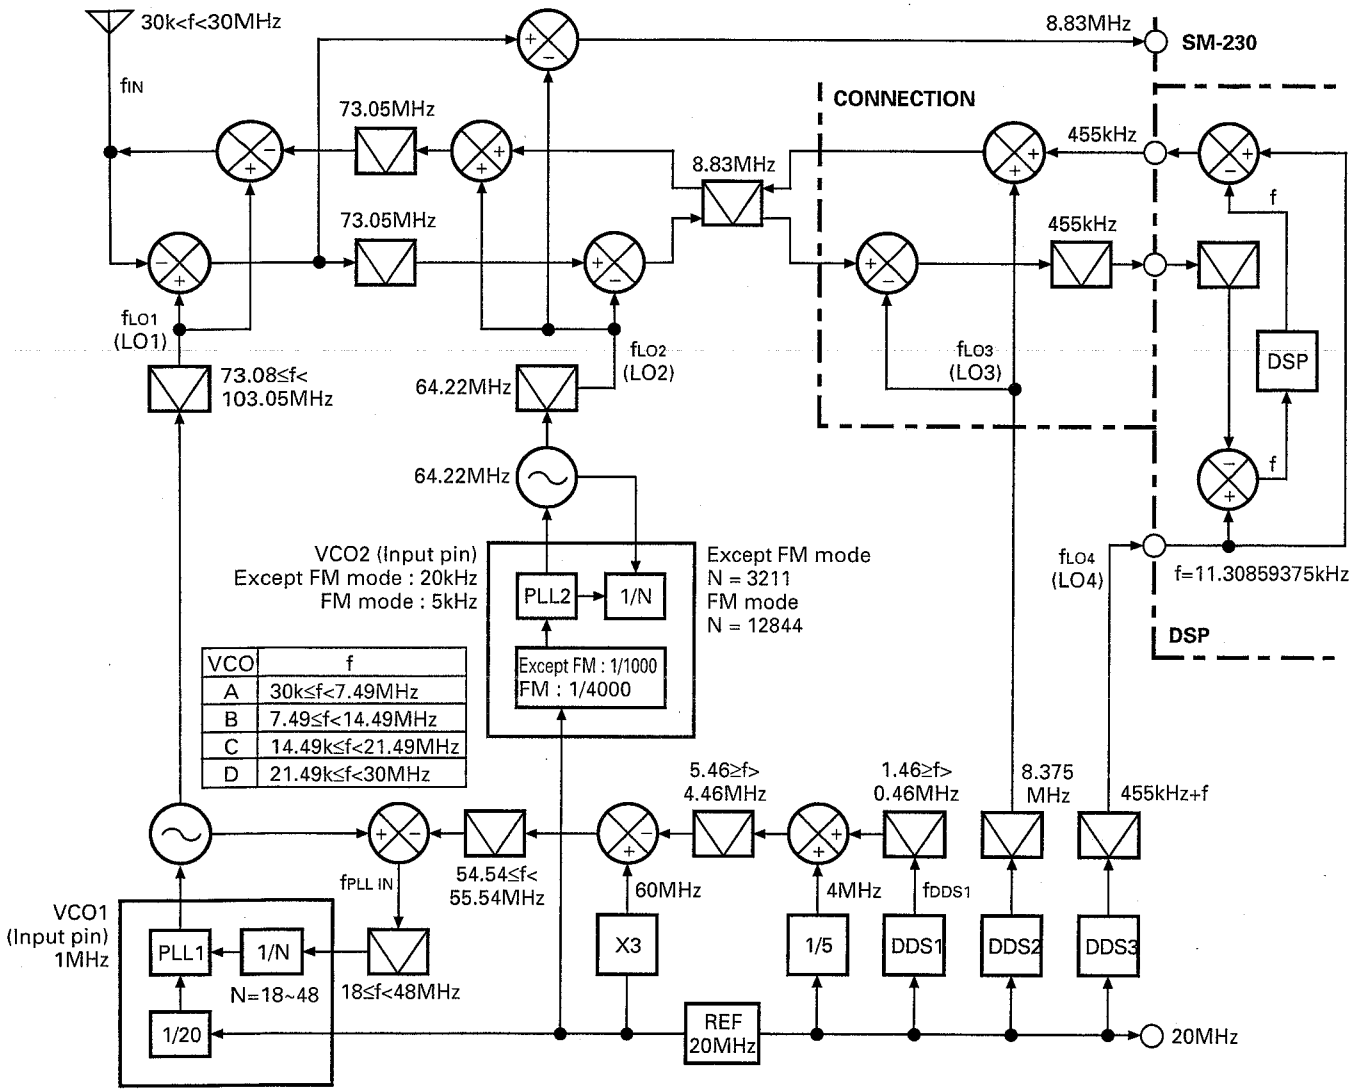

Fig. 6 Frequency configuration

TS-870S

CIRCUIT DESCRIPTION

Transmitter Circuit

The transmitter system block diagram is shown in Figure 7.

The TS-870S has the same frequency configuration as the TS-850 after the DSP generates the IF signal and converts it to 455kHz as a basic configuration.

A difference from the conventional model other than DSP modulation is that the TS-870S uses a digital-to-analog converter and a microcomputer for various controls. This allows for fine control and reduces the number of controls needed for adjustment.

The TIF (second IF) signal output from the TX-RX unit goes to the final unit (C/5 connection section). The signal is converted from 455kHz to 8.83MHz. The 8.83MHz third IF signal converted by the Q470 and Q471: 3SK131(M) mixer is switched to the transmitter by the D450 diode switch, and output from CN412 to the RF unit (A/9 RF section) as TR88 signal.

The signal input to CN10 of the RF unit is passed through the 8.83MHz IF filter used for both transmission and reception. During transmission, XF3 BW: 5kHz is selected by D69 and D67 and the filter attenuates the components outside the band. The transmit signal switched by D68 is amplified and ALC-controlled by the Q39 ALC amplifier, and the resulting signal goes to the D49 TX gain control circuit. This circuit controls the gain at the transmission stage according to the given voltage via a variable attenuator of a pin diode. The control voltage is controlled by a microprocessor, and is used to set the gain for each band or set the gain with the PWR knob and mode.

The third IF signal is then converted to the 73.05MHz fourth IF signal by the Q37 and Q38 : 3SK131(M) mixer. The signal is passed through the LC filter, and is converted to the target frequency by the final local oscillator LO1 at the Q35 and Q36 : 3SK184(R) mixer. The signal is passed through the radiation filter and the band-pass filter used by both the transmitter and receiver sections to attenuate the spurious outside the band. The band-pass filter output is amplified by Q5 : 2SC2954, and output to the final unit (A/5 final section) from CN4 as the drive signal.

■ TX-AGC

The DSP controls the input level until it starts modulation. It is like AGC applied to the microphone amplifier, and when the input level exceeds the certain level, the amplifier gain decreases to keep the modulator input level constant, i.e., to keep the IF output constant.

The MIC gain control in SSB and AM modes is used to adjust the maximum gain of the AGC amplifier in the 40dB range. Even if the control is set maximum, the input level to the modulator is kept constant. If the PROC is OFF in SSB mode, the CAR level (TIF output level) is fixed, and the ALC effect is limited. If the PROC is ON in SSB mode, the ALC effect is adjusted by the CAR control. The microphone amplifier gain is fixed, but the speech processor input level is controlled by the AGC and then becomes the level set by the PROC control.

In FM mode, the microphone amplifier sensitivity can be changed to high or low by using Menu No.61. Since the frequency deviation is limited by the TX-AGC, it is not distorted extremely like in the clipper method. In AM mode, the sensitivity is controlled so that modulation does not exceed 70%.

The TX-AGC is required to stabilize the DSP modulator operation. The modulator may operate without using the AGC by reduction of the gain and input level, but it cannot be completely turned OFF. Care must therefore be taken when measuring the ALC properties and frequency characteristics.

CIRCUIT DESCRIPTION

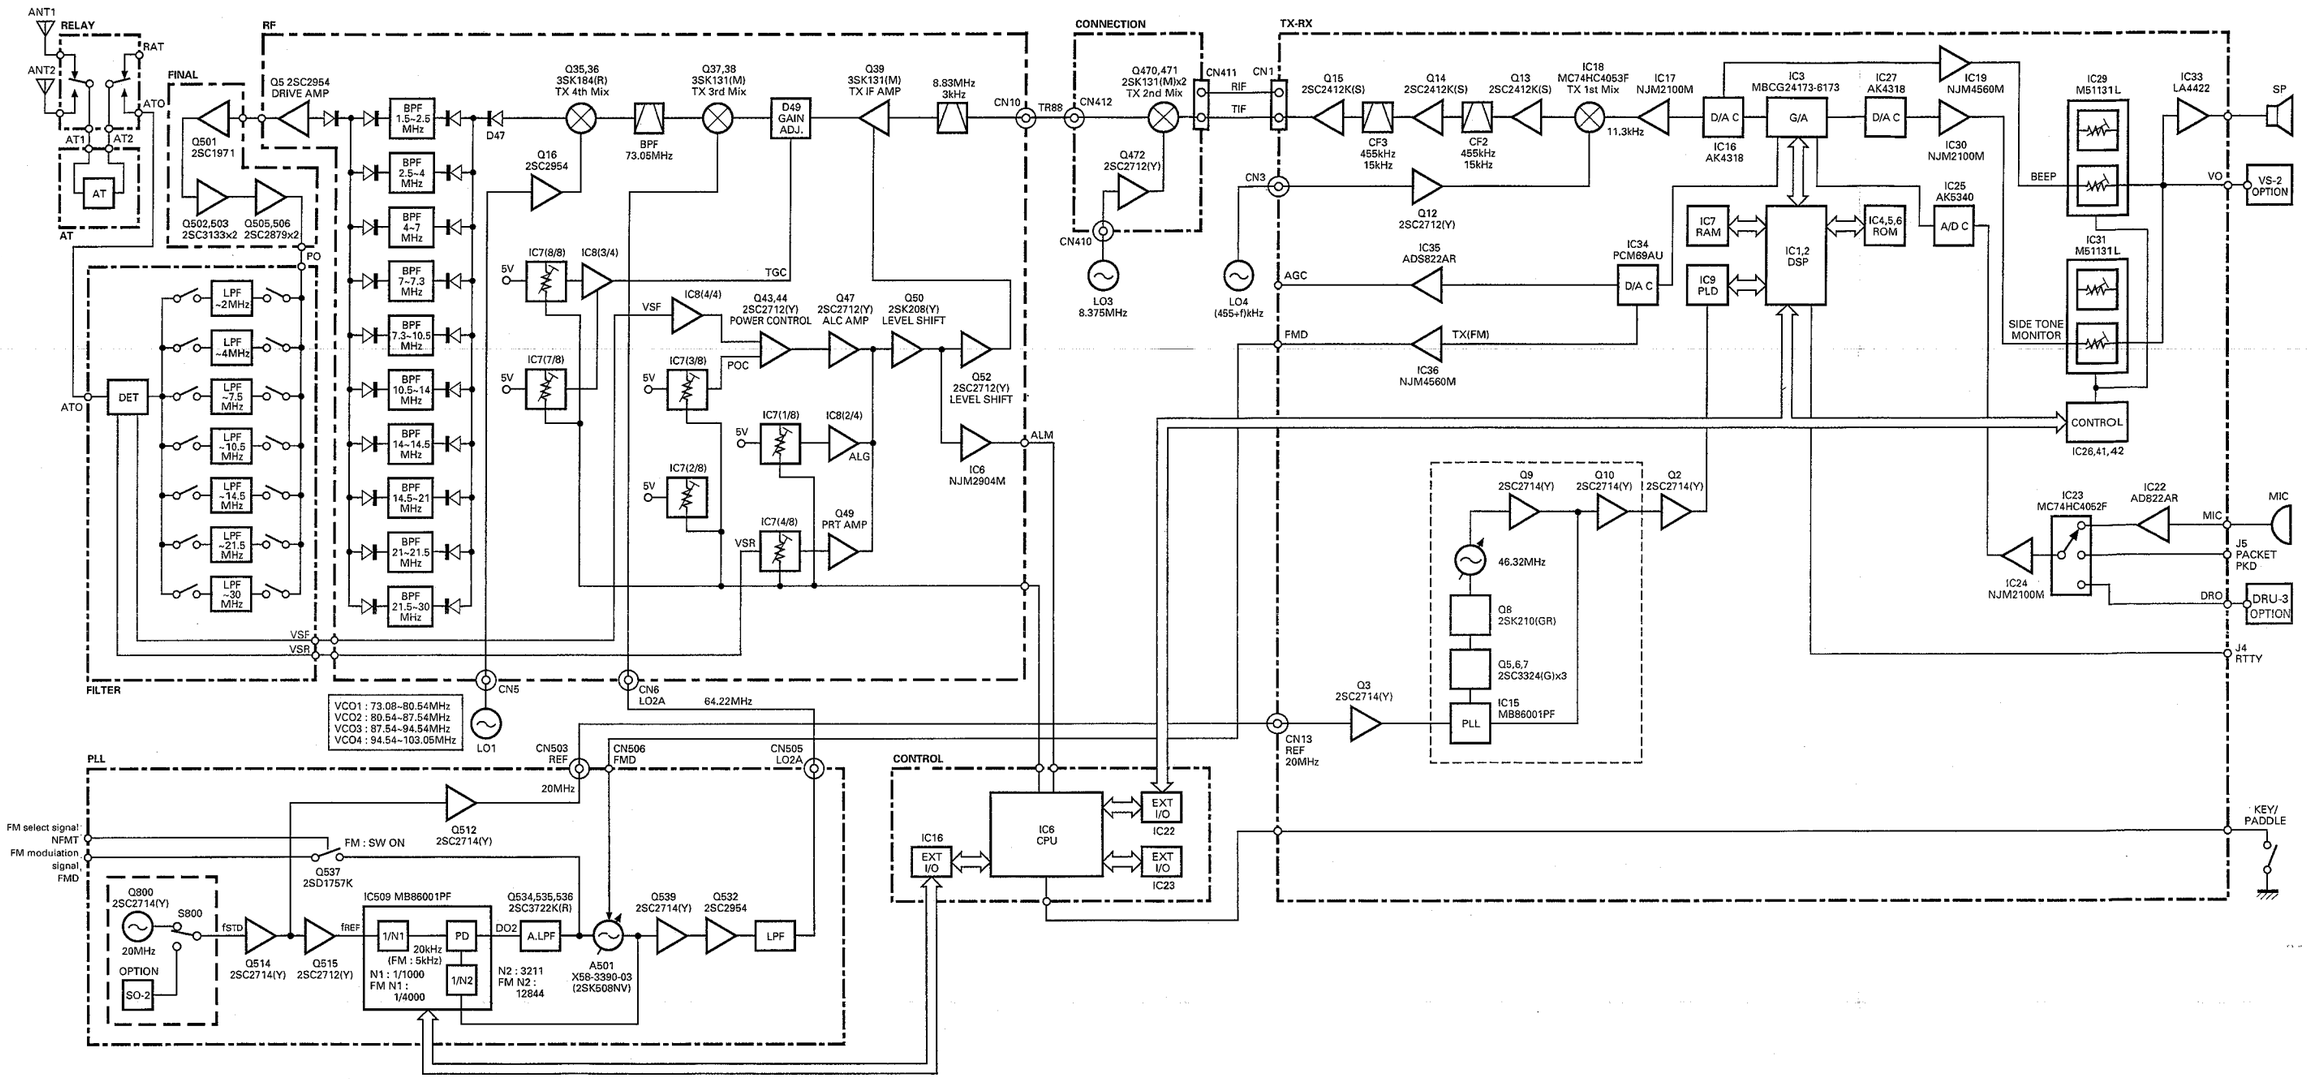

Fig. 7 Transmitter block diagram

CIRCUIT DESCRIPTION

■ Various control circuits by the digital to analog converter

The circuits whose signal levels were varied with volume controls or adjusted with semi-fixed volumes can be controlled with a microcomputer by using an 8-channel digital to analog converter.

The digital-to-analog converter (M62363FP) is a ladder-type variable attenuator with 8-channel independent inputs, which is used to output an output voltage by entering a fixed voltage, or is used as for volume by entering the control signals directly. Table 8 lists controls in each channel.

CH No.	PIN No.	Signal name	Control	Output to
1	2	ALG	ALC reference voltage	IC8-5 operational amplifier
2	3	NBV	NB threshold voltage	IC9-5 NB pulse generation circuit
3	10	POC	Power control reference voltage	Q43 ALC circuit differential input section
4	11	PRO	Reflected wave protection adjustment	Q49 protection control circuit
5	14	Unused		
6	15	Unused		
7	22	POVR	Gain correction for power control	IC8-10 TGC circuit
8	23	TXG	Gain correction between bands	IC8-9 TGC circuit

Table 8 digital-to-analog converter control

■ ALC circuit

The TS-870S uses the same control circuit as for the TS-850 as shown in Figure 8. Q43 and Q44 comprise a differential amplifier, and the VSF (forward wave voltage) signal is compared with the IC7-VO3 power control voltage (POC). The POC voltage is controlled by the microprocessor according to the power settings, such as power volume and mode-specific power down.

Q45 is a switch for average power control during AM transmission. In modes other than AM, the ALC is controlled by detecting the peak value, but in AM mode, a control output smoothing circuit is used to control output power with the average power.

In AM mode, the AMB signal and the base of Q46 go HIGH. The collector of Q48 goes HIGH, and about a 20ms pulse is input to the base of Q51 to turn it ON. Since Q45 is still OFF immediately after transmission starts, the ALC is controlled by detecting the peak value. However, average value control is used after about 20ms, and the average output does not change when modulation occurs. If the ALC is controlled by the average value soon after transmission starts, the ALC voltage does not stabilize for awhile and the preset power is exceeded. Thus, the ALC is controlled by detecting the peak value soon after transmission starts.

The differential amplifier output level is converted by Q47, Q50, and Q52, and the gain is controlled by the second gate of the Q39 ALC amplifier.

Q49 controls SWR protection using the adjusted VSR (reflected wave voltage) signal.

The level of the voltage taken from the ALC circuit is converted by IC6 (B/2) and the ALC meter signal is output to the A/D port of the control unit as the ALM signal. The ALC meter is adjusted so that it indicates a value according to the DSP output level set in the adjustment mode.

■ Transmission gain control

If transmission occurs with several bands as with an HF transceiver, the gain changes between bands due to the effects of frequency characteristics of the final unit, low-pass filter, or mixer circuit, and the CAR level must be adjusted each time the band is changed.

This model uses a pin diode variable ATT and microprocessor-controlled digital-to-analog converter to correct the total gain between bands and correct the gain with power control. Thus, the total gain is the same in each band.

TS-870S

CIRCUIT DESCRIPTION

■ CAR control

The CAR volume signal is read by the analog to digital converter and output to the DSP via the microprocessor. The DSP controls the output level required according to the mode. If PROC is OFF in SSB mode and in FM mode, the level is fixed, but in other modes it can be adjusted in the 30-dB range using the CAR control.

The level required for each adjustment is output in the adjustment mode to facilitate adjustment.

■ Final circuit

The drive output from the CN4 of the RF unit is input to CN501 of the final section (X45-351 A/5). The harmonics of the signal amplified to 100W by Q501 to Q505 are attenuated by a low-pass filter in the filter section (X45-351 B/5), and the resulting signal goes to the relay section (X45-351 E/5).

The transmit signal input to the relay section is passed through the transmit/receive switching relay, the through/in relay in the AT unit (X53-3340-02), and the ANT A/B switching relay, and goes to the ANT terminal.

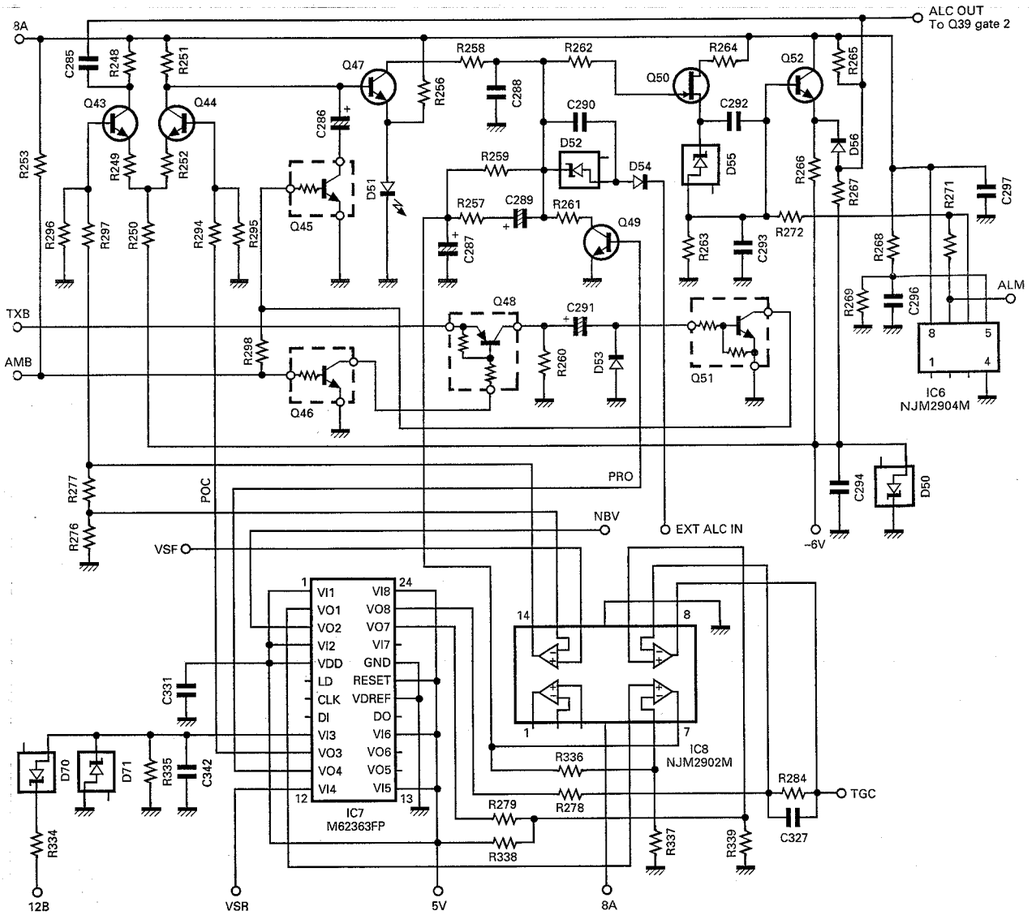

Fig. 8 ALC circuit

CIRCUIT DESCRIPTION

AT Unit (Auto Antenna Tuner)

When the AUTO/THROUGH switch is set to AUTO, ATA goes LOW, the AUTO/THROUGH switching relay K1 is executed, and AT is inserted to prepare for tuning. If "RX AT ON" is set in menu No.8, AT is inserted during reception. If the position of variable capacitor VC1 or VC2 is not the preset position of the band, presetting is performed. The AT tune and transmission do not occur until presetting ends.

When AT TUNE is turned on with this condition, ATS goes HIGH, the CW mode is set, and the transmission output becomes about 10W. If the SWR is lower than 1.2, the tuning is completed and auto antenna tuning ends. If the SWR is greater than 1.2, the motor control pulse duty (described later) is controlled according to the SWR.

The SWR can be set to 1.6 after AT tuning by turning menu No. 33 "TUNE WIDE" ON.

The motor speed is determined by a microcomputer. Its direction is controlled by phase comparator IC1 and amplitude comparator IC6 if the APRE is LOW, and controlled by the microcomputer if the APRE is HIGH.

■ Auto tuning mode

The transmission power from the final section via the filter section is passed through the current/voltage detection transformer L1 and L2, which use a troidal core. The current and voltage components detected here are rectified by the waveform rectification circuit consisting of D4, D7, Q1, and Q2, and then the phase is compared by IC1. The output signals ($\overline{Q}$ and Q) from pins 8 and 9 of IC1 are passed through the switch by IC2 and are applied to motor drive IC IC4. Variable capacitor VC1 is rotated by the motor M1 so that the phase difference of the voltage and current components decreases.

The voltage and current components detected by L1 and L2 are rectified by diodes D1 and D2 and are applied to the comparator of voltage comparison circuit IC6 as the amplitude component. The comparator output is passed through switch IC3. Motor M2 is driven by another motor drive IC IC5 and variable capacitor VC2 is rotated in the direction that decreases the amplitude difference of the voltage and current components.

Variable capacitor VC1 for capacity adjustment is therefore controlled so that the current and voltage phases match. Variable capacitor VC2 for resistance adjustment is controlled so that the current and voltage amplitude difference decreases. SWR becomes 1 when the phases match and the amplitude difference is zero.

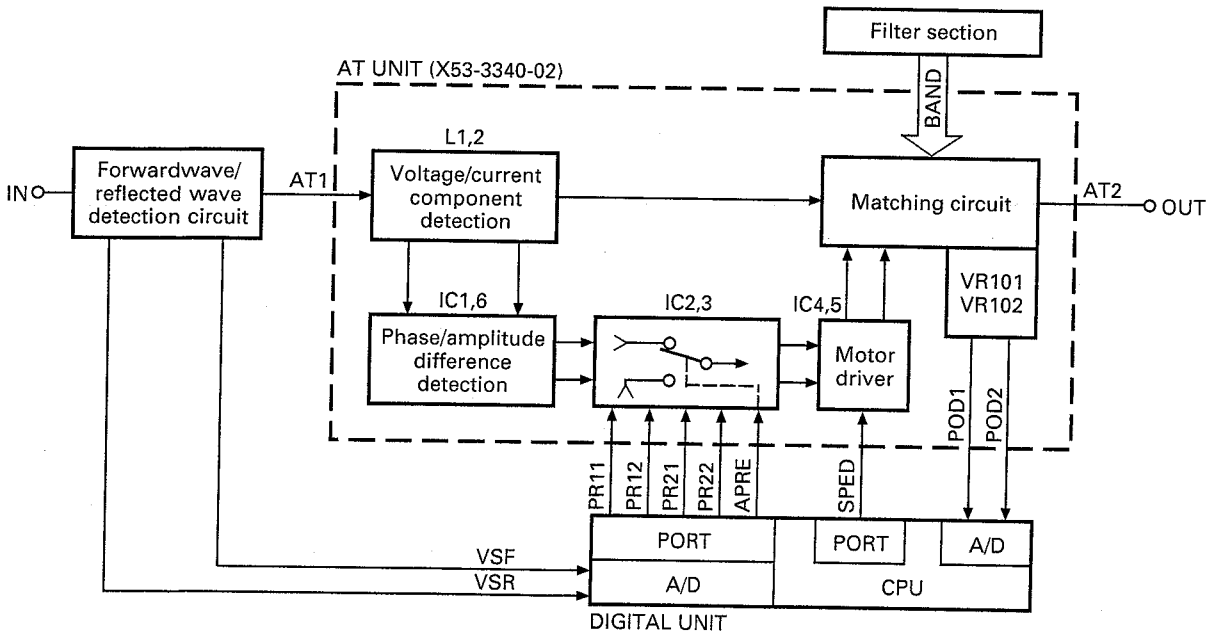

Fig. 9 AT unit block diagram

CIRCUIT DESCRIPTION

The speeds of motors M1 and M2 are determined by the duty cycle of the pulse input to control input pin 8 of IC4 and IC5, and controlled by the standing wave ratio (SWR) calculated by the control unit CPU.

Pulse signal SPED output from the control unit is passed through Q5 : DTC114EK, amplified by Q4, and input to IC4 and IC5 as a control pulse.

If the SWR is 2 or more, the duty cycle of the motor drive voltage pulse is 100%. If the SWR is 1.5 to 2, the duty cycle becomes approx. 80%. If the SWR is less than 1.5, the duty ratio becomes approx. 50% and the motor runs at low speed.

The matching circuit is T type, and the tap position from 1.8 to 30MHz is switched by seven relays K101 to K103 and K105 to K108.

Position detection volumes VR101 and VR102 are linked to the rotation axes of variable capacitors VC1 and VC2 with a gear ratio of 1 : 1. The voltages of 0 to 5V (POD1 and POD2) are generated according to the capacities of the variable capacitors. This position voltage data is sent to the microprocessor in the control unit through the analog to digital converter, and is used as the reference voltage in the feedback control system, such as for preset tuning. The same signal is also used for presetting data and end-detection.

The volume used by the TS-870S is a normal one, not an endless one. Since the rotation angle of this volume is limited, the rotation range is from the minimum capacity to the maximum capacity plus allowance.

By this control, like the preset tuning, which will be described later, POD1 and POD2 are monitored by the microprocessor. If the lower limit voltage of 0.6V or the upper limit voltage of 4.2V is reached, the microprocessor detects that the voltage is close to a limit. To return the voltage to the opposite side, APRE is made HIGH. If the variable capacitor is VC1, and the voltage is close to the lower limit in respect to POD1, the voltage near the upper limit is output. If the voltage is close to the upper limit in respect to POD1, the voltage near the lower limit is output.

The other variable capacitor VC2 outputs the voltage read by POD2 as it is. If the variable capacitor voltage exceeds the specified limit, it returns to the other limit. The other variable capacitor remains in the same position.

If the APRE is HIGH, the motor rotation direction is determined by the CPU unless auto tuning is performed.

The logic for PR11 to PR22 is the same as for IC4 and IC5 : BA6109U2. The signal output from the digital unit passes through IC2 and IC3 : TC4066BP and enters IC4 and IC5.

		PR11	PR12	PR21	PR22
Motor 1	Normal rotation	H	L	–	–
	Reverse rotation	L	H	–	–
Motor 2	Normal rotation	–	–	H	L
	Reverse rotation	–	–	L	H

■ Preset tuning

When tuning ends, the position of the variable capacitor is stored in memory by the microprocessor as preset data for that band.

When the band is changed after tuning is performed in another band, APRE goes HIGH, the motor is controlled by the microprocessor, and preset tuning is performed. During preset tuning, auto tuning or signal transmission is inhibited even if the AT TUNE switch is pressed or transmission becomes ready.

The initial preset-data when the microprocessor is reset includes standard data for a 50-ohm load on each band.

CIRCUIT DESCRIPTION

Standby Control and Timing

Standby control and timing are carried out by using software for the main CPU in the control unit (X53-356X-XX). The control signals for the control unit are listed below. (See Figure 10 for each timing chart.)

SS : Standby switch input signal. Active LOW.
KEY : Keying input signal from the keyer. Active LOW.
TXC : Transmission output signal. Active HIGH. Same timing as TXB.
RXC : Reception output signal. Active HIGH. Same timing as RXB.
CKY : Output signal. Active HIGH.

CIRCUIT DESCRIPTION

Digital Control Unit

The TS-870S digital control circuit has a multiple chip configuration centered around the main CPU (IC6 : M37702S4BFP), and consists of a 64K ROM (IC12 : 27C512RJLVC), an 8K RAM (IC8 : LC3564QME-10), and an extended I/O (IC16, IC22, IC23 : CXD1095Q). This circuit controls about 60 different input and about 80 different output signals.

Figure 11 is a digital control block diagram.

■ Address control

The main CPU operates in the microprocessor mode in which the external ROM is used. The memory is configured as shown in the memory map, and the main CPU A12 to A15 and D0 signals and IC14, IC17, IC18, and IC19 are used to generate a chip select (CS) signal to select and access an IC. (Figure 12)

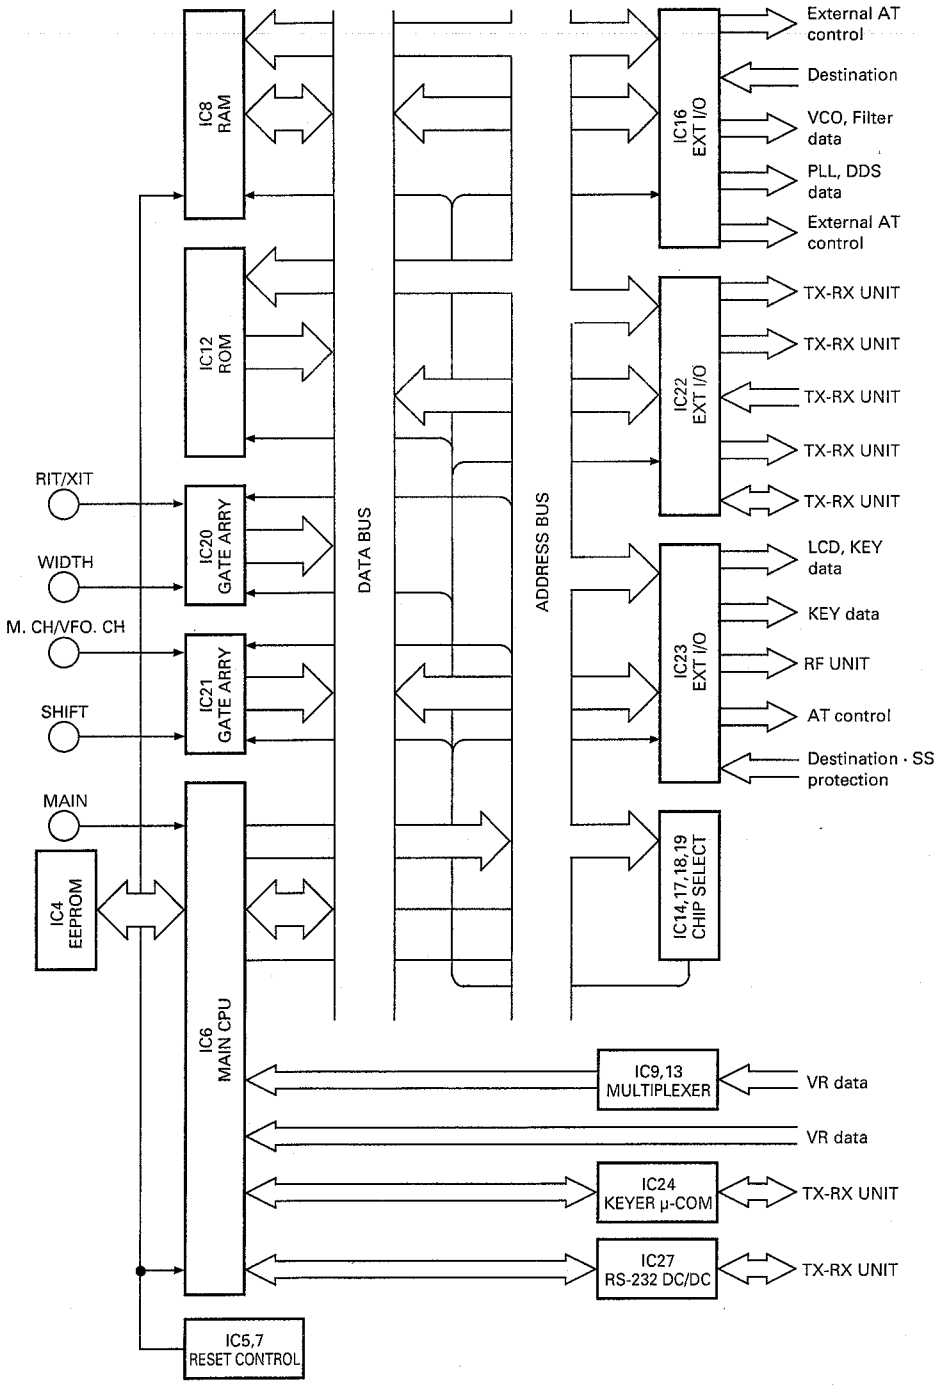

Fig. 11 Digital control block diagram

CIRCUIT DESCRIPTION

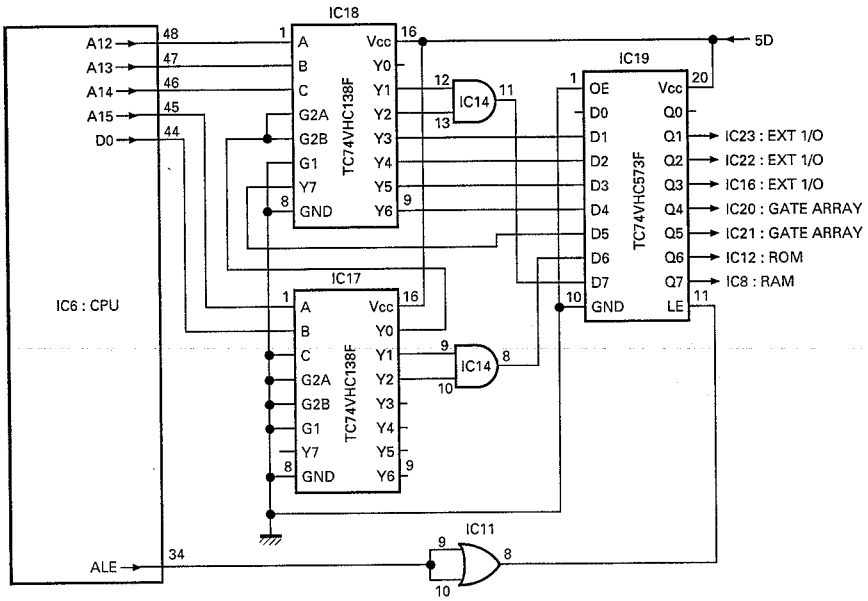

Fig. 12 Address control circuit

■ Encoder circuit

The main encoders are magnetic rotary encoders, and the click, RIT, SHIFT, and WIDTH encoders are contact-type rotary encoders.

The main encoder pulses are read directly by the main CPU.

The other encoder pulses enter the gate array (IC20 and IC21 : LZ92K371), and are read through the main CPU data bus. The gate array is selected by the latch (IC19 : TC74VHC573F) Q4 and Q5. The CK1, CK2 or CK3, CK4 encoder is selected by A0 of the gate array. Encoder data is output to D0 to D7 by making the read signal (RD) LOW when the chip select (CS) signal is LOW. IC25 and IC26 absorb encoder pulse chattering. (Figure 13)

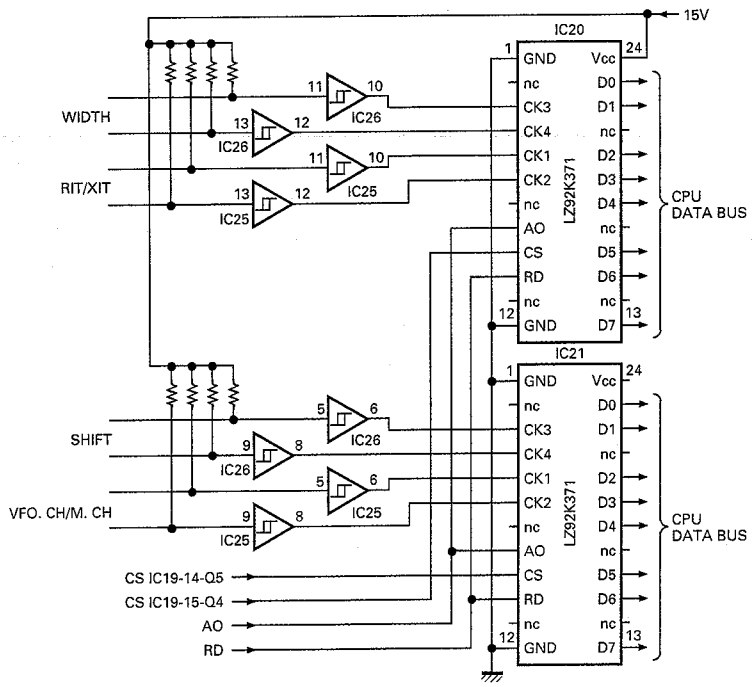

Fig. 13 Encoder circuit

CIRCUIT DESCRIPTION

■ System reset and RAM backup

The power monitor circuit (Q1, Q2, D4, D5, R6) monitors the power supply voltage. If the voltage is LOW, the circuit outputs a LOW signal to the INT1 port of the main CPU and the IRQ2 port of the microprocessor in order for the electronic keyer to stop operation. At the same time, the battery backup IC (IC5 : MB3780A) backs up the RAM with a lithium battery.

If the power supply voltage becomes normal, a HIGH signal is input to the INT1 port and the IRQ2 port, and the main CPU is initialized by the battery backup IC after the time constant set by C56 and C57. The operation resumes and power is supplied to the RAM from the outlet. (Figure 14)

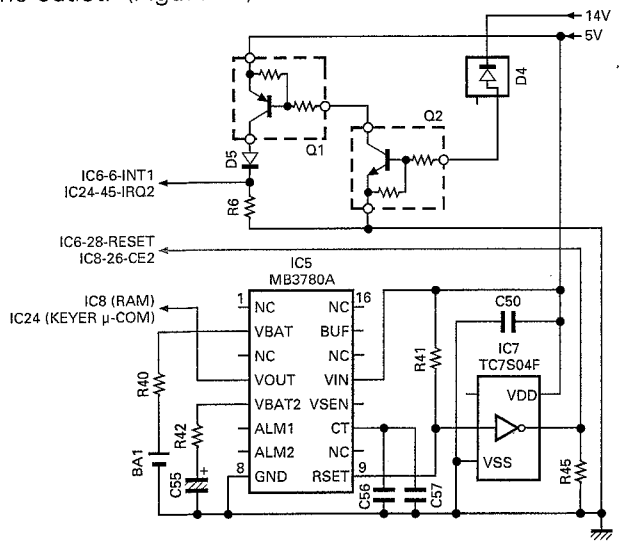

Fig. 14 System reset and RAM backup

■ Analog Signal Input

The main CPU incorporates an 8-channel analog-to-digital (A/D) converter, and in addition, has a multiplexer (IC9 and IC13 : TC4052BF) for entering 16-channel analog signals. Incoming analog signals are converted by the main CPU to digital values, which are used as digital data.

■ Display

Since the TS-870S uses a negative LCD and a fluorescent display tube.

The LCD is lighted with half a duty by the LCD driver, and the fluorescent display tube is lighted by an inverter.

The LCD driver data is set by the clock signal (UCK1), data signal (UDA1), and enable signals (ENL2, ENL3). The blanking signal (BLANK) turns the LCD driver OFF, and the dimmer signal (DIM) changes the inverter duty for dimmer.

■ Key scan

The PB0 and PB7 of IC23 and O2 to O8 of IC501 form a keyboard matrix. A key scan signal (a negative pulse) is output from the O2 to O8. One column corresponding to the PB0 and PB7 is selected, and the state of that switch is read. When the switch at the intersection of the matrix is pressed, the PBx port bit goes LOW. Thus, which switch is pressed can be detected. The key chattering is eliminated by software. (Figure 15)

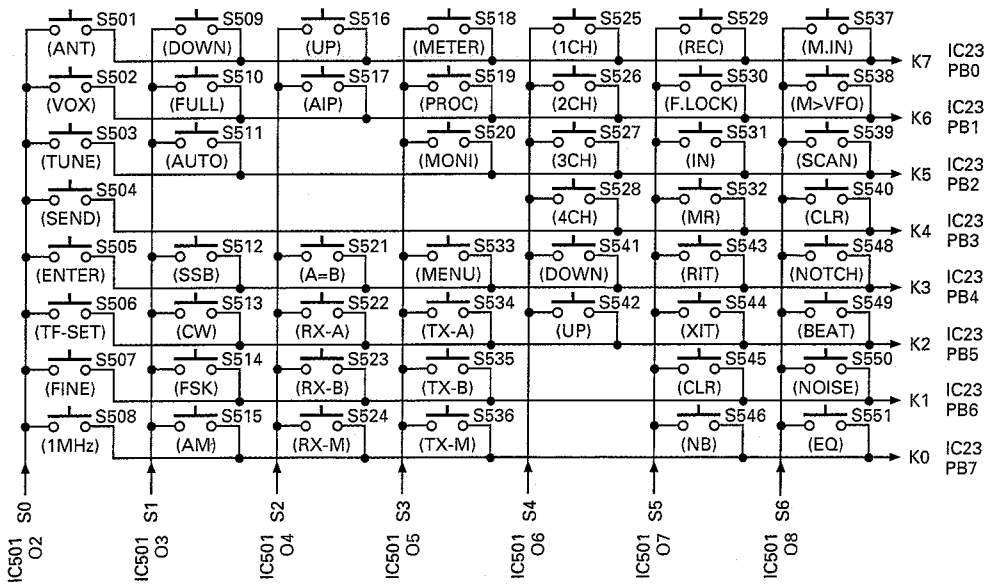

Fig. 15 Key scan circuit

CIRCUIT DESCRIPTION

■ PLL and DDS data

The TS-870S has three PLLs and three DDSs in the PLL section in the RF unit. The main CPU sends data to the PLL ICs and DDS ICs according to the displayed frequency. The PLL ICs provide unlock (UNL) signals. If one of the PLLs should unlock, the display indicates that the PLL is unlocked (Err-FE).

The TX-RX unit also has a PLL IC, to which the main CPU sends 46.32MHz data. The PLL IC also outputs an unlock signal (PLUL), and if a PLL is unlocked, an unlock message (Err-FD) is displayed.

■ AT control

The AT control inputs the variable capacitor position data (POD1, POD2, analog data input), forward wave voltage and reflected wave voltage (VSF, VSR, analog data input) for SWR calculation in the main CPU, and outputs the motor normal/reverse rotation control (PR11, PR12, PR21, PR22), motor speed control signal (SPED), and motor control switching signal (APRE).

SPED switches the motor rotation ON and OFF during AT tune and presetting by PWM with the duty cycle related to the SWR value.

APRE changes the motor normal/reverse rotation control to analog control for AT tune, and to digital control for presetting.

PR11 to PR22 control the motor normal/reverse rotations and stop when the motor normal/reverse control signal is controlled digitally. (Figure 16)

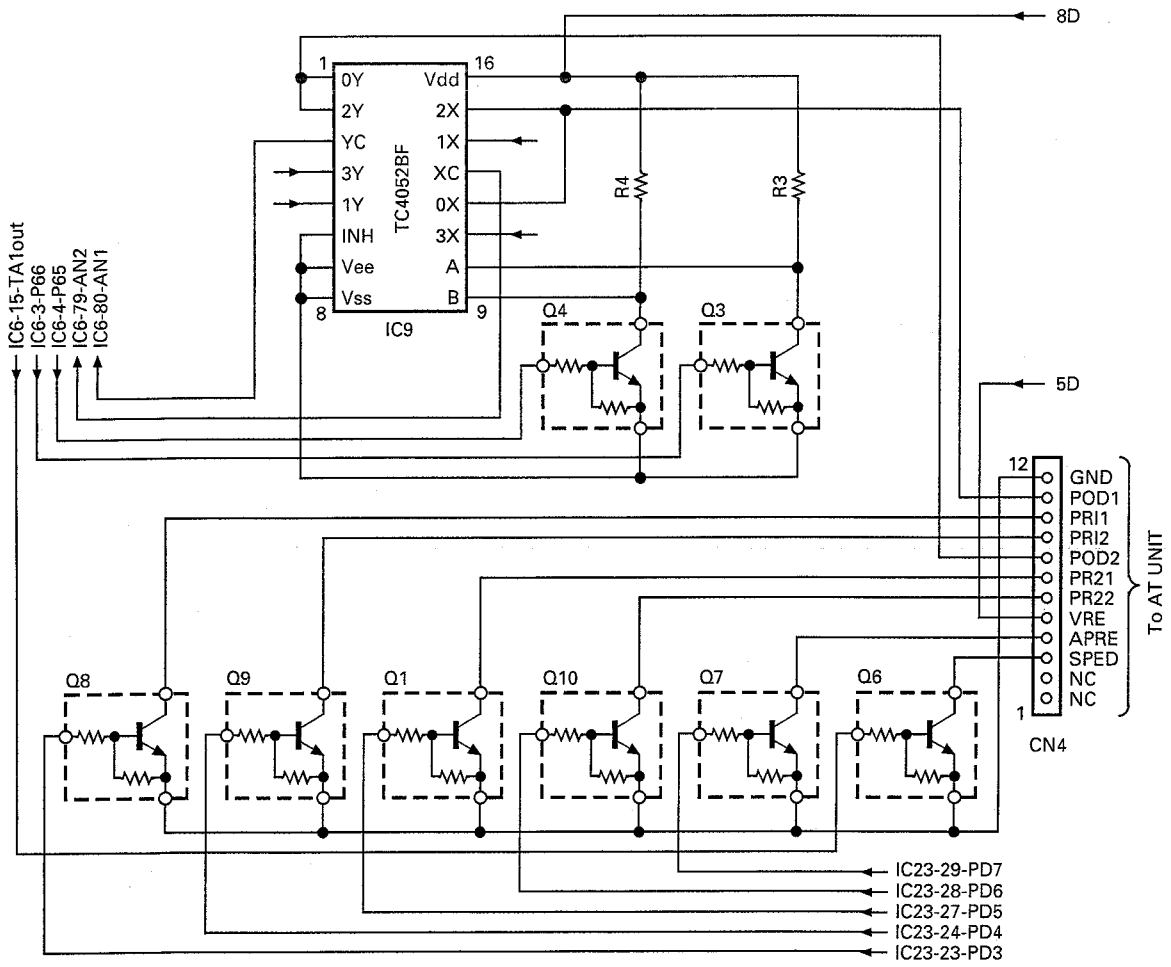

Fig. 16 AT control

CIRCUIT DESCRIPTION

■ IF filter switching

The IF filter switching signal from the control unit is controlled by PC0 to PC2 (pins 11 to 13) of IC23 and sent to the RF unit and final unit connection section.

The RF unit selects the 8.83MHz IF filter, and the final unit connection section selects the 455kHz IF filter.

The IF filter select signal is automatically interlocked with the WIDTH control.

SSB		CW		FSK		AM		FM	
WIDTH	IF FILTER	WIDTH	IF FILTER	WIDTH	IF FILTER	WIDTH	IF FILTER	WIDTH	IF FILTER
1.4k	3k	50	3k	250	3k	5.0k	6k	5.0k	15k

3.4k	↑								
4.6k	↑								
6.0k	15k								

Table 9 IF filter selection

■ Receive band-pass filter selection

The RF BPF signal from the control unit is sent from PC6 (pin 17) of IC23 to the RF unit as serial data. The serial-to-parallel converter (TC9174F) in the RF unit converts serial data to parallel data and switches between band-pass filters.

■ Transmit low-pass filter selection

The LPF signal from the control unit is sent as serial data from PC1 (pin 12) of IC16 to the final unit filter section via the final unit connection section. The serial-to-parallel converter (TC9174F) in the final unit filter section converts serial data to parallel data and switches between low-pass filters.

■ PLL VCO data

The RF unit PLL section switches between VCOs according to the VCO band data (VB0 to VB3) output from PC4 to PC7 (pins 15 to 18) of IC16 in the control unit.

■ Electronic keyer

The TS-870S uses a dedicated IC (IC24 : 68HC05G2419553) to control the electronic keyer. The main CPU CH1 to CH4 signals switch operations to the electronic keyer IC (keyer microprocessor).

The keyer microprocessor controls the electronic keyer according to KEY SPEED VR data, DOT/DASH signal, and CH1 to CH4 signals switch operation signals from the main CPU.

The keyer microprocessor is normally at the standby mode (power save mode). Each control signal is connected to PB7 (pin 77). When this port is LOW, the standby mode is terminated.

When the standby mode is cancelled, PA7 (pin 30) outputs a HIGH signal. It is used to determine which control signal is active : CH1 to CH4, KEY SPEED VR data, or DOT/DASH signal.

PA2 (pin 25) is an input/output port that inputs KEY SPEED VR data and outputs control signal (HIGH) for VR data determination.

When a HIGH signal is output from PA2 (pin 25), C114 is charged. KEY SPEED VR data is calculated until C114 is discharged and the port goes LOW.

IRQ2 (pin 41) is an interrupt port that detects power supply voltage drop. When this port detects it, the standby mode is entered.

The keyer microprocessor outputs the key down and beep signals. The key down signal is input to IC22 (PC4 : pin 15), and the main CPU controls transmission and reception. The beep signal is input to IC29 (TC7S32F : OR gate) and output to the TX-RX unit as CKY.

The TX-RX unit determines the key jack ON/OFF and CKY level and outputs sidetone.

CIRCUIT DESCRIPTION

TX-RX Unit (DSP Operation)

■ Outline

The TS-870S uses the DSP to carry out various processing as compared with the conventional models. They include the following:

- Modulation and demodulation
- Filter processing
- AGC processing (S-meter data output)
- Mic amplifier AGC processing
- VOX processing
- Voice equalizing processing
- Noise processing (noise reduction, beat cancel, automatic notch)
- Speech processing (COMP meter data output)
- Squelch processing
- Sidetone and beep generation

The commands and data for the microprocessor are listed below (see page 42).

The TX-RX unit circuits are divided into the analog section that processes analog signals and digital section that processes digital data. The interface between the analog and digital sections is the analog-to-digital converter (IC25 : AK5340-VS) and digital to analog converter (IC16 and IC27 : AK4318-VS, IC34 : PCM69AU).

The unit has another digital to analog converter (IC26 : M62363FP) for VCA (electronic volume : M51131L) control. The volume is controlled directly by the microprocessor in the control unit (the volume is not controlled by the DSP).

■ Digital section

The digital section is explained below. Figure 17 is a digital section block diagram.

The digital section consists of two DSPs (IC1 and IC2 : DSP56002FC40), RAM (IC7 : MCM56824AFN2*), three ROMs (IC4, IC5, IC6 : 27C256PCJJ**), and gate array (IC3 : MBCG24173-6173) and PLD (IC9 : 7032LC44JLQ*). The TX-RX unit has a PLL, but it is included in the digital section for convenience. * indicates the version number.

The PLL in the TX-RX unit is controlled directly by the microprocessor in the control unit, and clocks of a fixed frequency of 46.32MHz are generated. This circuit forms a VCO consisting of Q8 : 2SK210(GR), Q9 and Q10 : 2SC2714(Y). Q8 is an oscillator and Q9 and Q10 are buffer amplifiers. Q5, Q6, and Q7 comprise an active low-pass filter. This low-pass filter converts the output from PLL IC IC15 : MB86001PF to DC voltage and sends it to the VCO.

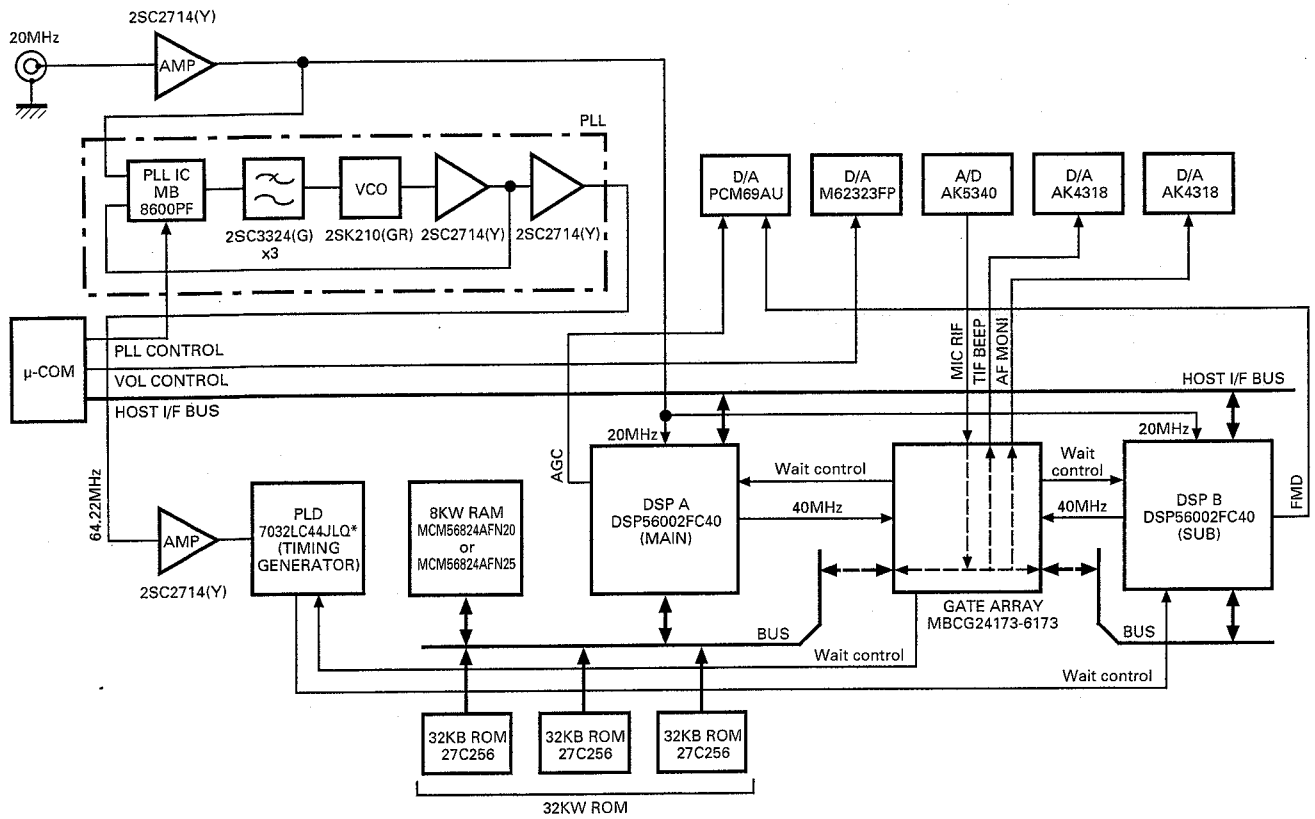

Fig. 17 Digital section block diagram

CIRCUIT DESCRIPTION

Figure 18 is a block diagram of the PLD (Programmable Logic Device). The clock with a sampling frequency fs (45.234375kHz) is generated from the 46.32MHz clock produced by the PLL in the TX-RX unit by the clock divider in the PLD. This clock is used for data transmission and reception between the analog-to-digital and digital to analog converters and gate array and data transmission and reception between the gate array, DSP, and the analog to digital and digital to analog converters. The PLD forms part of the bus control circuit for sharing the RAM and ROM with two DSPs and the circuit that accesses the ROM.

The gate array is used as the interface between the analog to digital and digital to analog converters and the DSP. Data is received from the analog to digital converter, or transmitted to the digital to analog converter, and each DSP is interrupted in the 1/fs sampling intervals. The gate array interfaces two DSPs for communication, and the two other DSPs control the bus for sharing the RAM and ROM.

The DSP has a 24 bit fixed-decimal DSP. It operates with the 40MHz clock, but the external 20MHz clock is given to the DSP. The DSP operates the 40MHz clock generated in the PLL in the IC. The clock is programmed to be output to pin 123 (CKOUT) of the DSP. Transfer of commands with the microprocessor is carried out through the host interface of the DSP.

The ROM and RAM are shared by two DSPs. When one of the DSPs is being accessed, the other DSP waits. It is carried out by the gate array and PLD. Three 8 bit ROMs are used to implement 24 bits.

The analog to digital converter (IC25 : AK5340-VS) is an 18 bit Δ-Σ type ADC for audio equipment. There are two channels, R and L. The R channel is used for the receive signal and the L channel is used for the microphone input signal. The digital to analog converter (IC16 and IC27 : AK4318-VS) is a 18 bit Δ-Σ type DAC for audio equipment. The digital to analog converter has two channels like the analog to digital converter : IC16 uses the R channel for the beep signal and the L channel for the transmit signal, and IC27 uses the R channel for the monitor signal and the L channel for the decode signal. Another digital to analog converter (IC34 : PCM69AU) is an 18 bit DAC for audio equipment, and uses the Rch for AGC and the L channel for audio signals in FM.

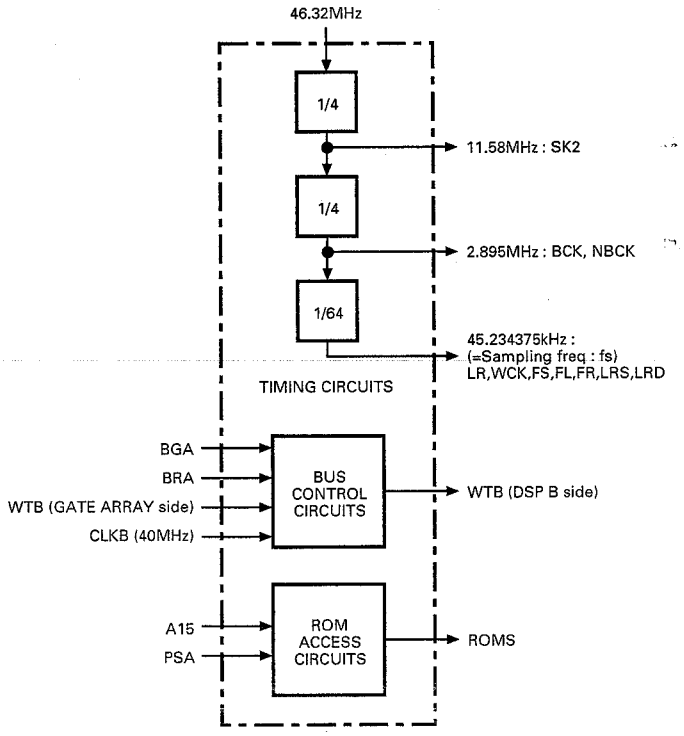

Fig. 18 PLD block diagram

■ Flow of transmit/receive signals

Flow of transmit/receive signals is explained below, together with the analog and digital sections. Flow of receive signals is explained first. See Figure 19.

The receive signal input from pin 3 (RIF) of CN1 is amplified by IC43 : NJM5532M. If a HIGH signal is input to RIF, its amplitude is limited to prevent any signal that exceeds the input range to the analog to digital converter (IC25 : AK5340-VS). The signal is passed through the band-pass filter and buffer amplifier, and its frequency is converted by the mixer (IC18 : MC74HC4053F). The frequency of the receive signal is about 1/4 of sampling frequency fs. The fs/4 frequency is the most stable frequency for digital signal processing. The receive signal of the fs/4 frequency is passed through the buffer amplifier, amplified by amplifier IC21 : NJM4560M, and converted to digital data by the analog to digital converter (IC25).

CIRCUIT DESCRIPTION

This data is read into the gate array (IC3 : MBCG 241873-6173) in sampling intervals 1/fs. The data read into the gate array is fed to the DSP in 1/fs for processing. DSP A (IC1 : DSP56002FC40) carries out auto notching, demodulation, noise processing, and squelch processing, and DSP B carries out AGC and filter processing.

AGC data, one of the DSP B operation results, is sent to the digital to analog converter (IC34 : PCM69AU) from pin 33 of DSP B (IC2: DSP56002 FC40) in 1/fs intervals. AGC data is converted to an analog current by IC34, and converted to an analog voltage by the I-V converter IC35 : AD822AR, and is output to the RF unit as the AGC voltage. The AGC voltage is reversed by the reversing amplifier IC35 : AD822AR, and the S-meter voltage used for packet communication is generated and output from the SMET terminal of ACC2 (J5).

The digital data demodulated by two DSPs is sent to the gate array in 1/fs intervals. The data is sent to the digital to analog converter (IC27 : AK4318-VS) from pin 68 of the gate array in 1/fs intervals and converted to an analog signal. The demodulate signal converted to an analog signal is passed through the third low-pass filter IC28 : NJM2100M. This low-pass filter eliminates the alias components. The demodulate signal then enters the VCA (IC29 : M51131L). The VCA attenuates and outputs the demodulate signal according to the voltage given to pin 8 of IC29. The voltage at pin 8 is the voltage corresponding to the rotational angle of the AF VOL, and is controlled by the microprocessor in the control unit. The demodulate signal is passed through the VCA, amplified by the AF amplifier (IC33 : LA4422), and output to the speaker and headphone.

Demodulation data used for packet communication is passed through low-pass filter IC28 : NJM2100M, then attenuated by the VCA IC31 : M51131L. The attenuation amount is determined by the value set on the menu. The signal is passed through the VCA and ACC2 (J5) through the buffer amplifier Q17 : 2SC 2412K(S), and output to the TNC.

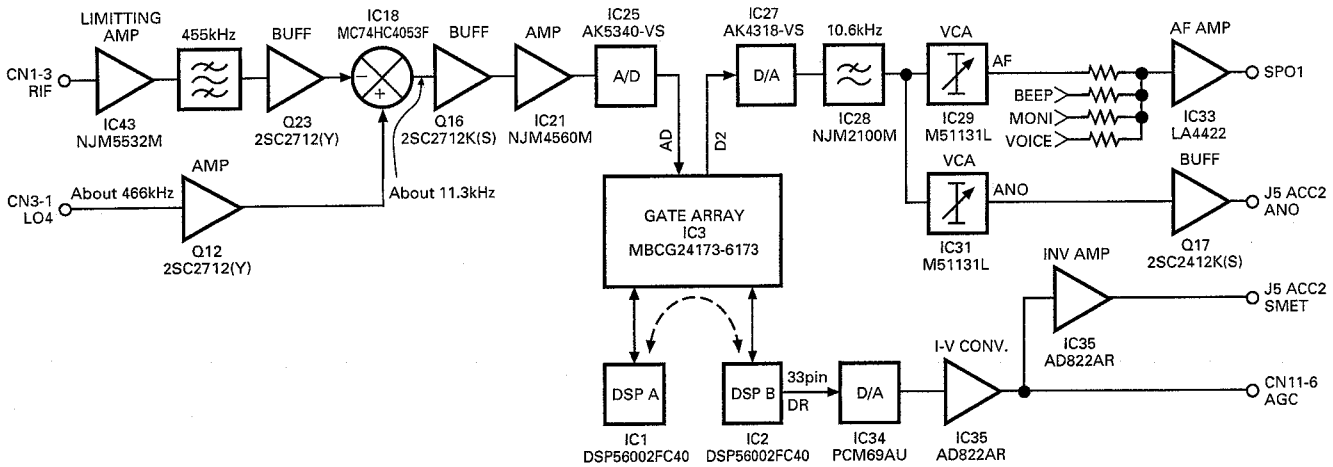

Fig. 19 Flow of receive signal

CIRCUIT DESCRIPTION

Then, flow of transmit signals is explained below. See Figure 20. If the mode is SSB, FM, or AM, the signal from the microphone is input. The signal enters the TX-RX unit through CN4. The signal is amplified by amplifier IC22 : AD822AR, and goes to the multiplexer (IC23 : MC74HC4052F). The multiplexer is used to switch between the microphone signal, the play signal from the DRU-3 (option), and packet signal. The signal passing through the multiplexer is amplified by amplifier IC24 : NJM2100M, and converted to digital data by the analog to digital converter (IC25 : AK5340-VS). The data is read into the two DSPs in the same way as for the receive signal. In transmit mode, DSP A carries out modulation, speech processing, and carrier signal generation in CW, FSK, and FM modes, while DSP B carries out VOX processing, voice equalizing processing, preemphasis processing (in FM mode), and microphone amplifier AGC processing.

The DSP does not perform modulation in FM mode. The DSP sends a 455kHz carrier signal from pin 1 (TIF) of CN1, adds subtone to the carrier signal, preemphasizes sounds, and limits the amplitude. Preemphasized audio data is sent from pin 33 of DSP A (IC1 : DSP56002FC40) to the digital-to-analog converter (IC34 : PCM69AU) in 1/fs intervals, and converted to an analog current. The analog current is converted to the audio signal of the analog voltage by the I-V converter IC36 : NJM4560M. IC36 also serves as the third low-pass filter that eliminates the alias components of the audio signal. The analog audio data signal is output from pin 3 (FMD) of CN3 to the PLL section.

The data modulated by the two DSPs (including FM carrier data) is sent to the gate array in the process as the demodulated signal. The signal is sent from pin 60 of the gate array to the digital to analog converter (IC16 : AK4318-VS) in 1/fs intervals, and converted to an analog signal. The frequency of this signal is fs/4. The analog modulated signal is passed through the third low-pass filter IC17 : NJM2100M to eliminate alias components. The signal is converted to the 455kHz IF signal by the mixer (IC18 : MC74HC4053F) and two ceramic filters (CF2 and CF3), and output from pin 1 (TIF) of CN1.

Monitor data, one of the DSP operation results, is sent to the gate array in the same process as the demodulate signal. Like the demodulate signal, the signal is sent from pin 68 of the gate array to the digital to analog converter (IC27 : AK4318-VS), and converted to an analog signal. The analog sidetone signal is passed through the third low-pass filter IC30 : NJM2100M and attenuated by VCA (IC31 : M51131L). The attenuation is determined by the rotational angle of MONI VOL. The flow of the signal after passing through the VCA is the same as for the demodulate signal.

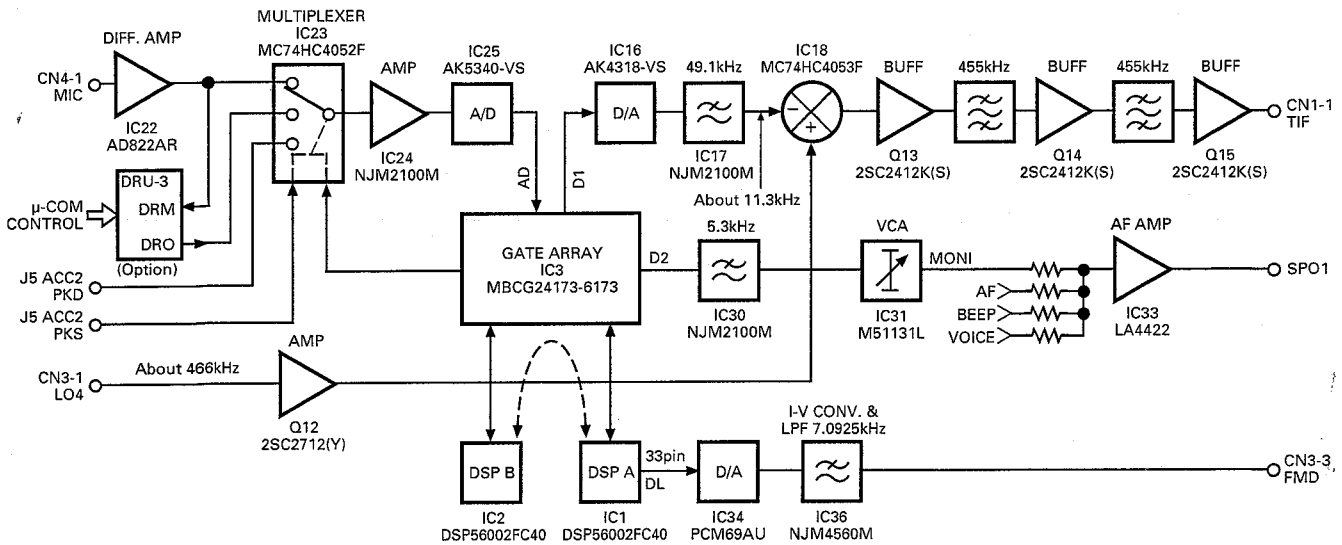

Fig. 20 Flow of transmit signal

CIRCUIT DESCRIPTION

■ Sidetone signal flow

When the electronic keyer is pressed, the sidetone is output. The sidetone is processed by DSP A. Sidetone data, a DSP A operation result, is output to the speaker or headphone in the same process as the monitor data. See Figure 21.

■ FSK tone signal flow

The flow of the FSK tone signal is the same as that of the sidetone. See Figure 21.

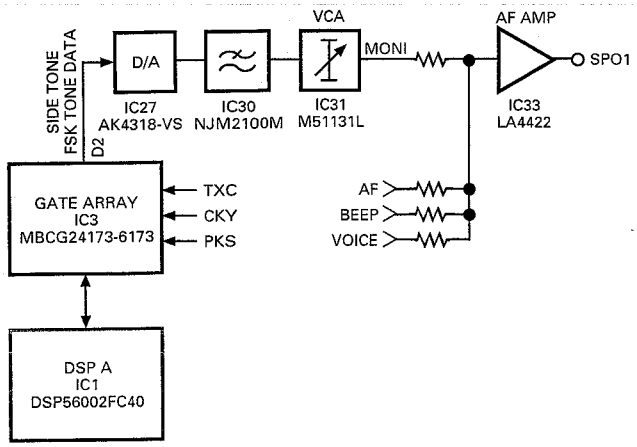

Fig. 21 Sidetone and FSK tone signal flow

■ Beep signal flow

When pin 6 (BEEP) of CN7 goes HIGH, DSP A sends beep data to the gate array in the same process as the demodulate signal. Like modulation data, the signal is sent from pin 60 of the gate array to the digital to analog converter (IC16 : AK4318-VS) in 1/fs intervals, and converted to an analog signal. The analog beep signal is passed through the primary low-pass filter IC19 : NJM4560M, and attenuated by VCA (IC29 : M51131L). The attenuation is determined by the value set on the menu. The flow of the signal after passing through the VCA is the same as for the demodulate signal.

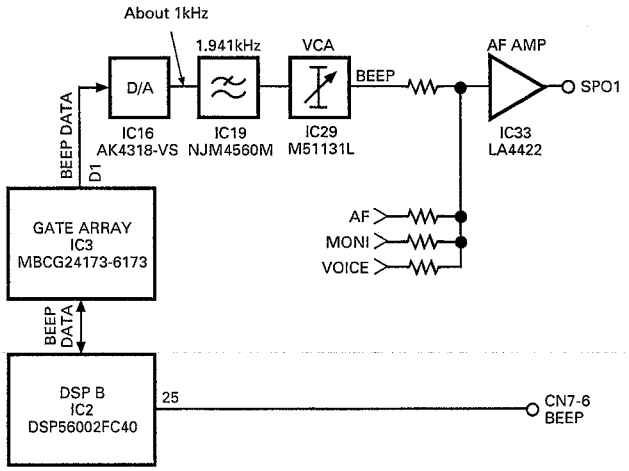

Fig. 22 Beep signal flow

■ DRU-3 recording and playback

The DRU-3 is controlled by the microprocessor in the control unit. During the DRU-3 recording, the MIC signal amplified by the differential amplifier (IC22 : AD822AR) is input to the DRU-3, and recorded. During DRU-3 playback, the playback signal is input to the analog-to-digital converter by switching the multiplexer (IC23 : MC74HC4052F). When the DSP receives a command "VOX ON and DRU playback" from the microcomputer, pin 38 of DSP B (IC2 : DSP56002FC40) goes HIGH and the SS line goes LOW. When the SS line goes LOW, the microprocessor sets the transceiver to transmit mode. This operation does not occur at the playback sound level of the DRU-3. Even if no sound is recorded, the transceiver enters the transmit mode when a DRU playback command arrives while VOX is ON. See Figure 20.

■ VS-2 audio signal flow

The audio signal output from the VS-2 is not processed by the DSP. The signal is amplified by the AF amplifier, and output to the speaker or headphone. The VS-2 is controlled by the microprocessor. See Figure 23.

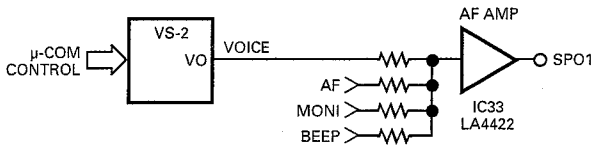

Fig. 23 VS-2 audio signal flow

CIRCUIT DESCRIPTION

■ Commands and data transferred to or from the microprocessor

To understand the DSP processing, the commands sent from the microcomputer to the DSP, and data sent from the DSP to the microcomputer are described below.

For details of error status, see the error list (Table 10).

1) Microprocessor → DSP

- Transmit mode
- Transmit filter
- CW rise (fall) time
- FSK shift width
- Squelch level
- Applicable filter follow speed
- SPAC interrelation time
- Check mode operation setting
- VOX delay time
- AGC release time
- TX AGC release time
- AGC correction
- TX equalizing
- FM modulation
- Processor compression level (LOW)
- Processor compression level (MID)
- Processor compression level (HIGH)
- RX AF AGC gain (AM/FM)
- RX AF AGC gain release time (AM/FM)
- TX AGC gain (packet input)
- Receive mode
- Receive filter
- CW pitch frequency
- FM subtone frequency
- Noise/interference elimination mode setting
- Auto notch follow speed
- Operation flag 1
- VOX gain
- RF gain (AGC)
- TX AGC gain
- AM modulation
- Carrier level
- Operation flag 2

2) DSP → Microprocessor

- S-meter data
- Compression level data
- Squelch status
- Microphone level data
- Error status
- Check mode status

Error No.	Error description
00	TX-RX unit is not connected.
01	Main DSP stack error
02	Main DSP trace error
03	Main DSP software interrupt
04	Main DSP SSI reception
05	Main DSP SSI exceptional reception
06	Main DSP SCI reception
07	Main DSP SCI exceptional reception
08	Main DSP SCI transmission
09	Main DSP SCI line idle detection
0A	Main DSP NMI
0B	Main DSP invalid command detection
0C	Command cannot be transferred from the main DSP to the sub DSP.
10	RAM check error 1
11	RAM check error 2
12	Gate array check error
21	Sub DSP stack error
22	Sub DSP trace error
23	Sub DSP software interrupt
24	Sub DSP SSI reception
25	Sub DSP SSI exceptional reception
26	Sub DSP SCI reception
27	Sub DSP SCI exceptional reception
28	Sub DSP SCI transmission
29	Sub DSP SCI line idle detection
2A	Sub DSP NMI
2B	Reserved
2C	Reserved
2D	Sub DSP invalid command detection
2E	Reserved
F0	Main DSP timeover error
F1	Sub DSP timeover error
FD	PLL unlock (TX-RX unit)
FE	PLL unlock (RF unit PLL section)
FF	Temperature protection error

Table 10 Error list

CIRCUIT DESCRIPTION

■ New function circuit

The TS-870S noise processing, auto notch, line enhancer, SPAC, and beat cancel functions are characteristics of the DSP digital signal processing. These functions and other features are described below.

1) Auto notch

The auto notch corresponds to the IF filter used in the previous models. It is an adaptive filter, and emphasizes weak signals by tracking interfering signals automatically in the AGC loop (the reception gain increases). The notch filter has very good damping and frequency characteristics in the receiving bandwidth.

2) Beat cancel

The "beat cancel" corresponds to the AF filter used in the previous models. It also is an adaptive filter, and finds and removes beat components from the received signal. Unlike the notch filter, this filter removes multiple beats, but it does not emphasize weak signals even if the beat is canceled.

3) Noise reduction

The TS-870S uses a line enhancer or SPAC to reduce noise. One of these two functions should be assigned to the N.R. key on the front panel.

The line enhancer is an adaptive filter which does not attenuate the target signal, but attenuates only noise. If the conditions are not very bad, the S/N ratio can be improved greatly.

Select SPAC to improve the S/N ratio effectively. SPAC stands for "Speech Processing System by use of Auto Correlation function." It takes the periodical signal (target reception signal) and suppresses noise using the Auto Correlation function. Since SPAC takes reception signals with a certain time width, the signals become discontinuous and cause noise.

Since the auto notch, beat cancel, and line enhancer are adaptive filters, their characteristics change according to the input signal. If the automatic tracking is set to OFF on the menu when the filter effect is good under good signal conditions, the effect does not change even if the conditions turn bad.

4) VOX

DSP processes the correlation between the received signal and signal from the microphone, and carries out the conventional anti-VOX processing. Therefore, TS-870S does not have anti-VOX.

5) SSB modulation/demodulation

TS-870S uses the PSN modulation/demodulation used for TS-950 and subsequent models. With the increase in the DSP operation precision, the side-band suppression has been improved in a very wide bandwidth from 25Hz to 6kHz (80dB or more for modulation and 90dB for demodulation). The PSN method does not eliminate all group-delay distortion because the Hilbert converter uses an IIR filter. The TS-870S uses a linear phase shifter with a Hilbert converter containing an FIR filter. As the FIR filter can keep group delay constant, it does not cause group-delay distortion. However, as the group-delay itself increases, if the linear phase shifter is set to ON via the menu, a signal is transmitted several ms after a voice enters the microphone.

■ Analog section and other circuits

The analog section and other circuits were described in the flow of transmission and reception signals. This section describes the circuits that were not explained in the flow of transmission and reception signals.

1) Reference voltage circuit

Since TS-870S does not have a negative power supply, a 2.5V reference voltage, which is half the power supply voltage, is supplied to the OP amplifier to process analog signals linearly. Fig. 24 shows this circuit. 2.5V are produced by dividing the power supply voltage by R129 and R132. This voltage is provided to the circuitry through buffer amplifier IC19 or IC20.

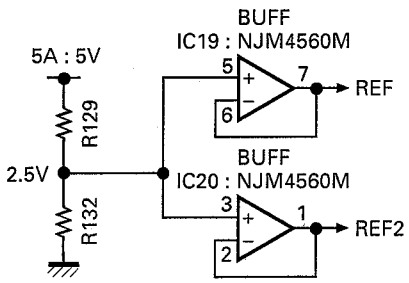

Fig. 24 Reference voltage circuit

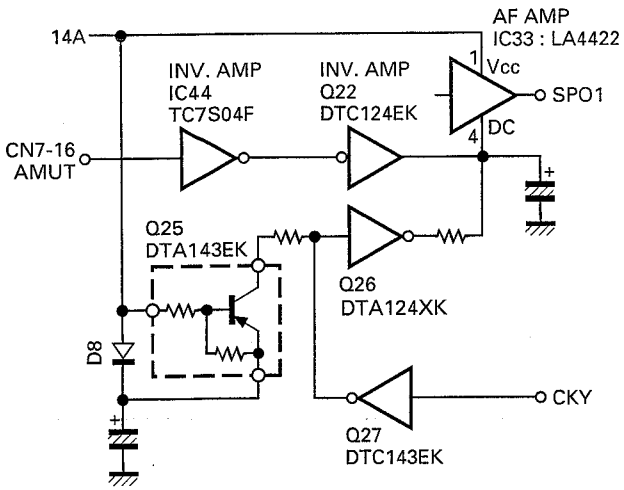
CIRCUIT DESCRIPTION

2) Pop mute circuit

The mute circuit shown in Fig. 25 reduces the pop sound when the power is switched ON and OFF. If CN7 pin 16 AMUT is LOW, the mute circuit consisting of IC44 : TC7S04F and Q22 : DTC124EK mutes the AF amplifier (IC33 : LA4422) and suppresses the pop sound when the power is turned ON. A microprocessor controls AMUT and cancels muting at an appropriate time.

When the power is turned OFF, muting is also controlled by AMUT, but is done only if the power switch ON TS-870S is pressed. The circuit comprising Q25 : DTA143EK, Q26 : DTC124XK, and Q27 : DTC143EK suppresses the pop sound when the external power supply switch is turned OFF. When this switch is turned OFF, the voltage of the AF amplifier power supply 14A decreases. When the 14A voltage falls, Q25 becomes active (ON), and then Q26 becomes active (the collector goes LOW to mute the AF amplifier and suppress the pop sound. Q27 prevents muting when the voltage of the AF amplifier power supply 14A falls during transmission.



The TS-870S uses AF amplifier IC33: LA4422 pin 4 (DC) as the mute pin.

Fig. 25 Pop mute circuit

■ Transmit/receive frequency characteristics correction circuit

The transmission sound quality has a flat frequency characteristic due to DSP modulation. However, the low-frequency range is also flat to the cut-off frequency, so the model has less clarity compared to the conventional transceivers. A correction circuit is provided to suppress the low-frequency range. It consists of R141, R155, and C145 in the TX-RX unit, and it is –2dB at 300Hz for 1kHz.

To return to the flat frequency characteristic, remove C145 and replace R155 with a 1.8kΩ resistor. (See Figure 26.)

The receive frequency is also flat, as well as the hi-fi sound quality when the filter is widened. When the receive frequency is flat, the volume of the low-frequency range becomes insufficient, so a correction circuit that slightly emphasizes the low-frequency range is provided. It consists of R204, R205, R208, and C208 in the TX-RX unit, and it is +2dB at 1kHz for 3kHz.

To return to the flat frequency characteristic, remove R205. (See Figure 26.)

D3	Voltage stabilization	5.1V
D4	Relay surge absorption	1.6~2.0MHz LPF relay
D5	Relay surge absorption	2.0~4.0MHz LPF relay
D6	Relay surge absorption	4.0~7.5MHz LPF relay
D7	Relay surge absorption	7.5~10.5MHz LPF relay
D8	Relay surge absorption	10.5~14.5MHz LPF relay
D9	Relay surge absorption	14.5~21.5MHz LPF relay
D10	Relay surge absorption	21.5~30.0MHz LPF relay
D11	Switching	

FINAL UNIT (X45-351X-XX) (C/5) : CONNECTION

Ref. No.	Use/Function	Operation/Condition
Q401~403	DC/DC	-6V
Q404	Ripple filter	14S → 14V
Q405	Ripple filter, AVR	
Q460, 461	Mixer	RX
Q470, 471	Mixer	TX
Q472, 475	Amplifier	TX IF
IC402	5V AVR	8V → 5V (For PLL)
D401	Rectification	
D402	Current stabilization	9V
D450	Reverse current prevention	
D451~456	RF switch	BPF switch
D457	Reverse current prevention	

FINAL UNIT (X45-351X-XX) (D/5) : AVR

Ref. No.	Use/Function	Operation/Condition
Q601	Switch	14S supply when power switch on.
Q701	Switch	On when fan operation
Q702, 703	Switch	Fan motor drive
IC601	8V AVR	13.8V → 8V (Analog 8V : 8A)
IC602	8V AVR	13.8V → 8V (Digital 8V : 8D)
IC701	Comparator	Fan control
D601	Relay surge absorption	
D701	Reverse current prevention	
D702	Surge absorption	

FINAL UNIT (X45-351X-XX) (E/5) : RELAY

Ref. No.	Use/Function	Operation/Condition
D301	Lightning surge protection	ANT1
D302	Lightning surge protection	ANT2
D303	Relay surge absorption	Antenna changeover relay
D304	Relay surge absorption	TX/RX changeover relay

DESCRIPTION OF COMPONENTS

AT UNIT (X53-3340-02)

Ref. No.	Use/Function	Operation/Condition
Q1, 2	Amplifier	Waveform shaping
Q3	Switching	On when APRE is "H".
Q4, 5	Switching	Motor speed control pulse
IC1	DFF	Phase difference detection  Function table: INPUTS (CLOCK, D) / OUTPUTS (Q, Q̄): ↑ L L H; L X Qo Q̄o
IC2	Analog switch	For control changeover motor 1 IC3	Analog switch	For control changeover motor 2 IC4	Motor drive	For motor 1 IC5	Motor drive	For motor 2
IC6	Comparator	Amplification difference detection
IC7	AVR	+5V
D1	Detector	Current component amplification detection
D2	Detector	Voltage component amplification detection
D3~8	Switching	Clipper
D10	Switching	Spike absorption
D101~103	Switching	Spike absorption
D105~108	Switching	Spike absorption
D109, 110	Switching	Band data

DESCRIPTION OF COMPONENTS

CONTROL UNIT (X53-356X-XX) (A/4) : CONTROL

0-11 : K,P 0-21 : M 0-22 : M2 0-71 : X 2-71 : E 2-72 : E2 2-73 : E3 2-74 : E9

Ref. No.	Use/Function	Operation/Condition
Q1, 2	Switching	Voltage drop changeover
Q3, 4	Switching	Multiplexer changeover
Q5	Switching	EEPROM write control changeover
Q6~11	Switching	AT control (PR11, PR12, PR21, PR22, APRE, SPED)
Q12, 13	Switching	AT-300 control and input (TS, TT)
Q14, 15	Switching	AT-300 control and output (TS, TT)
Q16	Switching	IC24 control (Reset)
Q17~19, 22	Switching	IC24 control (CH1, 2, 3, 4)
Q20, 24	Switching	IC24 control (DOT)
Q21, 23	Switching	IC24 control (DASH)
Q27	Switching	VBSY signal
Q28	Switching	KEY signal
Q29	Switching	Filter changeover (6kHz)
Q30	Switching	Filter changeover (3kHz)
Q31	Switching	Filter changeover (15kHz)
Q33	Switching	BLNK signal
IC1, 2	Regulator	5V output
IC3	Regulator	8V output
IC4	EEPROM	Adjustment data saving
IC5	Reset, Power supply changeover	System reset and Back-up power supply changeover
IC6	CPU	8 bit microcomputer (Main)
IC7, 10	Inverter	Reverse data
IC8	RAM	8K-byte
IC9, 13	Multiplexer	A/D data changeover
IC11	OR gate	RD/WR signal output
IC12	ROM	64K-byte
IC14	AND gate	Chip select combination for RAM and ROM
IC15	Bidirectional buffer	Data bus input/output changeover
IC16, 22, 23	Extended I/O	8 bit x 4, 4 bit x 1
IC17, 18	Decoder	Converts the address signal into a chip select signal for each IC.
IC19	Latch	Chip select signal latch
IC20, 21	Encoder gate array	Encoder pulse count
IC24	CPU	8 bit microcomputer (Electronic keyer)
IC25, 26	Schmitt trigger	Encoder chattering absorption
IC27	Level shift	RS-232 level shift
IC28	OP amplifier	Buffer
IC29	OR gate	CKY signal and BPC signal combination
D1~3	Protection diode	Power supply
D4	Voltage detector	Voltage drop detection (About 10V)
D5	Protection diode	Reverse current prevention
D6	Protection diode	KEYS line
D7	Protection diode	DASH line
D8	Protection diode	DOT line
D9	Protection diode	MD line
D10	Protection diode	MU line
D11	Protection diode	KEY line
D12	Protection diode	SS line

DESCRIPTION OF COMPONENTS

CONTROL UNIT (X53-356X-XX) (B/4) : SW

Ref. No.	Use/Function	Operation/Condition
Q501, 502	LED switch	
IC501~504	Serial/Parallel	Data conversion for tact switch and LED
D501, 502	LED	
D510~519	LED	

TX-RX UNIT (X57-4620-00)

Ref. No.	Use/Function	Operation/Condition
Q1	Switch	Change SS line to low when VOX active.
Q2	Amplifier	64.22MHz
Q3	Amplifier	REF 20MHz
Q4	Switch	On/Off when squelch open/close (For packet).
Q5, 7	Active LPF	
Q6	Active LPF	PLL loop filter
Q8	VCO	46.32MHz oscillation circuit
Q9, 10	VCO	Output buffer
Q12	Amplifier	LO4 466kHz
Q13, 15	Buffer	TX IF 455kHz
Q14	Amplifier	TX IF 455kHz
Q16	Buffer	Receive signal for DSP processing (11.3kHz)
Q17	Buffer	ACC2 audio output
Q22	Switch	Mute signal (Power on/off)
Q23	Buffer	RX IF 455kHz
Q25	Pulse generator	AF mute
Q26	Switch	Mute signal
Q27	Switch	Mute signal absorption (Mute inhibit when TX)
IC1	DSP A	Main DSP
IC2	DSP B	Sub DSP
IC3	Gate array	For interface
IC4	DSP ROM	Low (D0~D7) 32KB
IC5	DSP ROM	Mid (D8~D15) 32KB
IC6	DSP ROM	High (D16~D23) 32KB
IC7	DSP RAM	8K ward
IC9	PLD	Timing generator
IC15	PLL IC	46.32MHz clock generation
IC16	DAC	Rch : BEEP signal (About 1kHz) Lch : Transmission signal (11.3kHz)
IC17	Active filter	TX (fc = 49.1kHz) 3rd LPF
IC18	Mixer	RX : 455kHz → 11.3kHz TX : 11.3kHz → 455kHz
IC19	Voltage follower, Active LPF	Reference voltage buffer, BEEP LPF (fc = 1.9kHz)
IC20	Voltage follower	Reference voltage buffer
IC21	LPF, Buffer	RX IF 11.3kHz
IC22	Amplifier	Microphone amplifier, unbalanced/balanced modulation
IC23	Multiplexer	MIC, DATA, DRU-3 changeover
IC24	LPF, Buffer	TX microphone amplifier, unbalanced/balanced modulation
IC25	ADC	Rch : Reception signal Lch : Microphone input signal
IC26	DAC	VCA control
IC27	DAC	Rch : Monitor signal Lch : De-modulation signal
IC28	Active LPF	De-modulation signal (fc = 10.6kHz)
IC29	VCA (Electronic volume)	De-modulation signal, BEEP
IC30	Active LPF	Monitor signal (fc = 5.3kHz)
IC31	VCA (Electronic volume)	Packet AF, monitor
IC33	AF amplifier	Audio amplifier

TS-870S

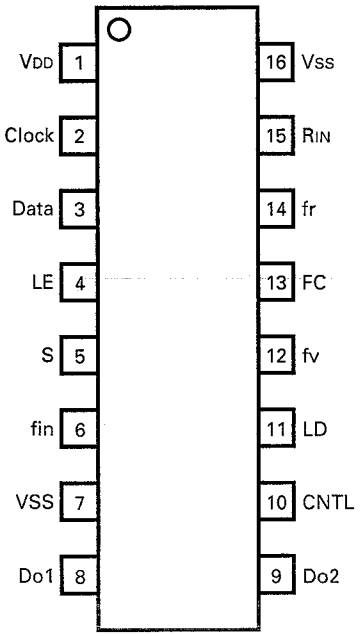
DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition
IC34	DAC	Rch : AGC signal Lch : FM modulation signal
IC35	I-V converter, Inverter	AGC and S-meter voltage
IC36	I-V converter, Active LPF	FM modulation signal (fc = 7.2kHz)
IC37	AVR	13.8V → Analog 5V
IC38	AVR	Digital 8V → Digital 5V
IC39	AVR	13.8V → 5V for PLL
IC40	AVR	13.8V → 8V for PLL
IC41, 42	Buffer	VCA control
IC43	Clipper amplifier	RX IF 455kHz
IC44	Inverter	Mute (Power on/off)
D1~4	Reverse current prevention	
D5	VCO bari-cap diode for DSP	64.32MHz oscillation
D7, 8	Reverse current prevention	

SEMICONDUCTOR DATA

PLL : MB86001PF (RF Unit IC507, 509, TX-RX Unit IC15)

■ Terminal connection diagram



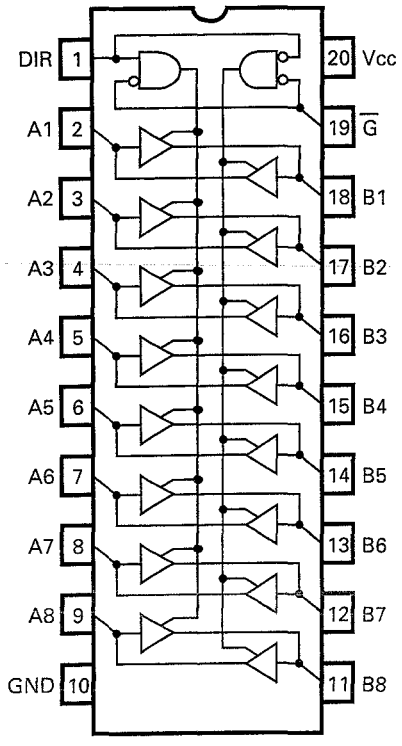
■ Terminal functions

Pin No.	Pin code	I/O	Function
1	VDD	–	Power supply pin.
2	Clock	I	Shift register clock input pin. Serial data is taken in at the rising edge of the clock signal. The input section contains a Schmitt trigger circuit.
3	Data	I	Serial data input pin for setting the divide ratio of each divider. The input section contains a Schmitt trigger circuit.
4	LE	I	Shift register load enable signal input pin. When LE is high, the divider ratio data is transferred to the latch specified by the control bit. This data is used as the divide ratio of each divider. The input section contains a Schmitt trigger circuit.
5	S	I	Switch pin for selecting the latch for setting the divide ratio of each divider. When the S pin is low, latch V1 is selected. When the S pin is high, latch V2 is selected. The divide ratio data is then sent to the divider.
6	fin	I	Divider input pin. The input section contains a bias circuit and an amplifier. Connect the voltage control oscillator (such as a VCO) by AC-coupling.
7	Vss	–	Ground pin.
8	Do1	O	Phase comparator output pin (charge pump). The Do1 output level can be reversed by FC. The reference divider output fr and divider output fv are related as follows. On when CNTL is low. fr > fv : High level (FC : Low), Low level (FC : High), fr = fv : High impedance, fr < fv : Low level (FC : Low), High level (FC : High)
9	Do2	O	Phase comparator output pin (charge pump). The relationships between the reference divider output fr and divider output fv are the same as for Do1. On when CNTL is high.
10	CNTL	I	Pin that controls charge pump outputs Do1 and Do2. The relationships between CNTL, Do1 and Do2 are as follows. When CNTL is low, Do1 : Output, Do2 : High impedance. When CNTL is high, Do1 : High impedance, Do2 : Output.
11	LD	O	Phase comparator output pin. When PLL is locked, LD is high. When PLL is unlocked, LD is low.
12	fv	O	Divider division output monitor pin. A signal is output from the pin in monitor mode. Normally, this pin has high impedance.
13	FC	I	Phase comparator input switch pin.
14	fr	O	Reference divider division output monitor pin. A signal is output from this pin in monitor mode. Normally, this pin has high impedance.
15	RIN	I	Reference divider input pin. The input section contains a bias circuit and an amplifier. Connect the reference oscillator (such as TCXO) by AC-coupling.
16	Vss	–	Ground pin.

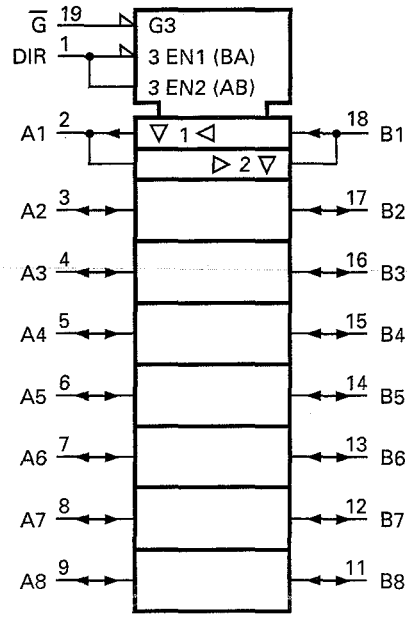
SEMICONDUCTOR DATA

Bidirectional buffer : TC74VHC245F (COntrol Unit IC15)

■ **Terminal connection diagram**



■ **Logic diagram**



■ **Truth table**

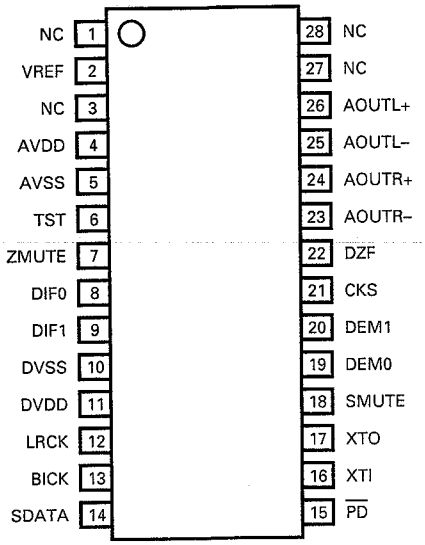
Input		Function		Output
$\overline{G}$	DIR	A bus	B bus	state
L	L	Output	Input	A=B
L	H	Input	Output	B=A
H	X	High impedance		Z

X : Don't Care Z : High impedance

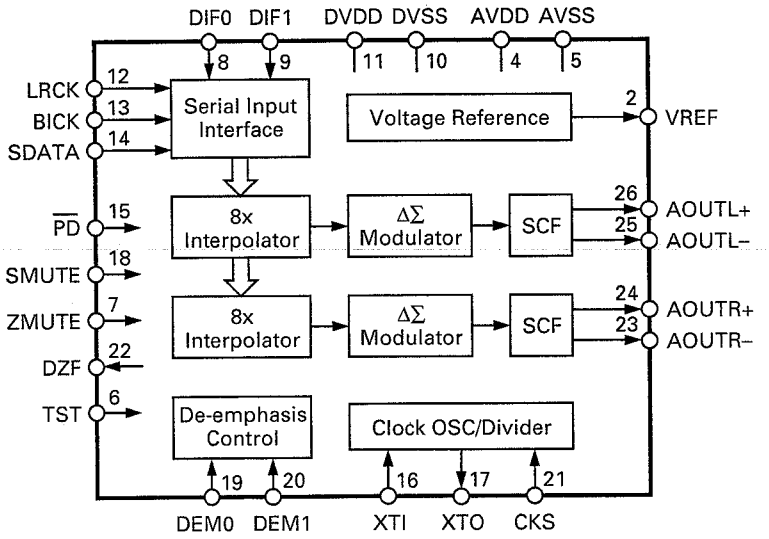
SEMICONDUCTOR DATA

DC/AC Converter : AK4318-VS (TX-RX Unit IC16, 27)

■ Terminal connection diagram



■ Block diagram



■ Terminal functions

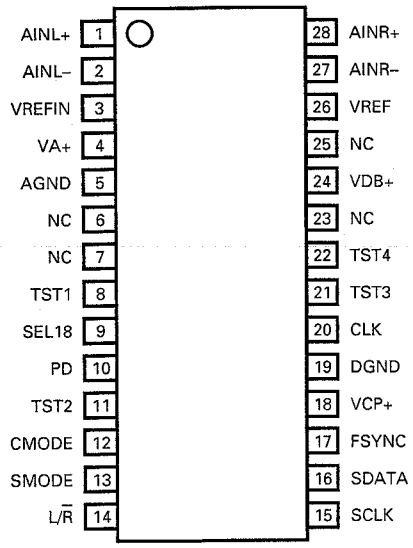
Pin No.	Pin name	I/O	Function
1	NC	–	
2	VREF	O	Reference voltage output pin (AVDD) – 3.75V. The 10µF electrolytic capacitor and 0.1µF ceramic capacitor are connected between VREF and AVDD.
3	NC	–	
4	AVDD	–	Analog power supply pin (+5V).
5	AVSS	–	Analog ground pin.
6	TST	I	Test pin (pull down). Must be open or low.
7	ZMUTE	I	Zero mute pin (pull down). High : Detects zero and mutes output.
8, 9	DIF0, DIF1	I	Input format pin. Supports four modes.
10	DVSS	–	Digital ground pin.
11	DVDD	–	Digital power supply pin (+5V).
12	LRCK	I	L/R clock pin. Determines the input serial data channel.
13	BICK	I	Serial bit clock pin. The clock latches serial data.
14	SDATA	I	Serial data input pin. Number two's complement MSB first.
15	$\overline{PD}$	I	Reset pin. When this pin goes low, the filter and modulator are reset. Make this pin low to reset the filter and modulator when the power is turned on.
16	XTI	I	Clock input pin. Connect a crystal oscillator between XTI and XTO or input the external CMOS clock to XTI. The clock frequency can be selected with the CKS pin.
17	XTO	O	Crystal oscillator output pin. If the crystal oscillator is used, connect it between the XTO and XTI pins. If the external clock is used, open this pin.
18	SMUTE	I	Soft mute pin (pull down). High : Soft mute, Low : Cancel
19, 20	DEM0, DEM1	I	De-emphasis mode pin. Supports three frequencies.
21	CKS	I	Clock select pin. Low : CLK 256 fd, High : CLK 384 fs
22	DZF	O	Zero input detection pin. High when the data input to the SDATA pin for both channels becomes zero 8192 times consecutively.
23	AOUTR–	O	Right-channel analog negative output pin.
24	AOUTR+	O	Right-channel analog positive output pin.
25	AOUTL–	O	Left-channel analog negative output pin.
26	AOUTL+	O	Left-channel analog positive output pin.
27, 28	NC	–	

TS-870S

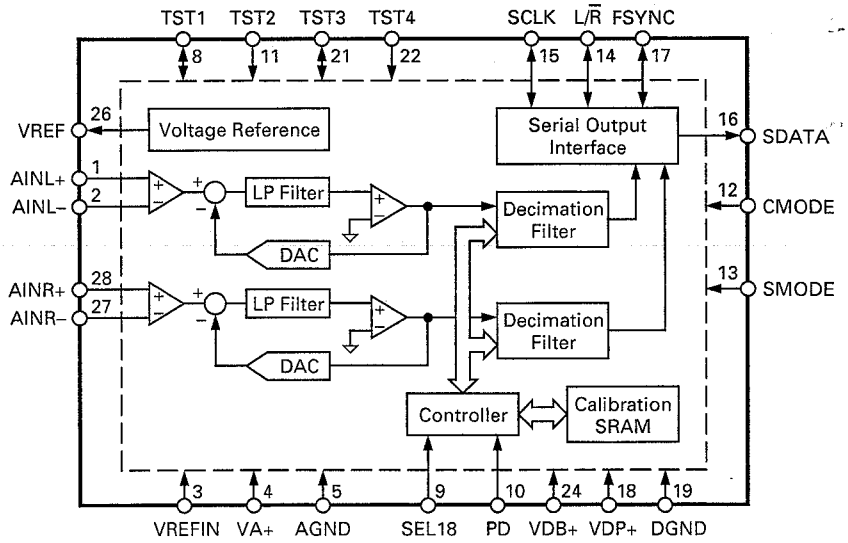
SEMICONDUCTOR DATA

AC/DC Converter : AK5340-VS (TX-RX Unit IC25)

■ Terminal connection diagram



■ Block diagram



■ Terminal functions

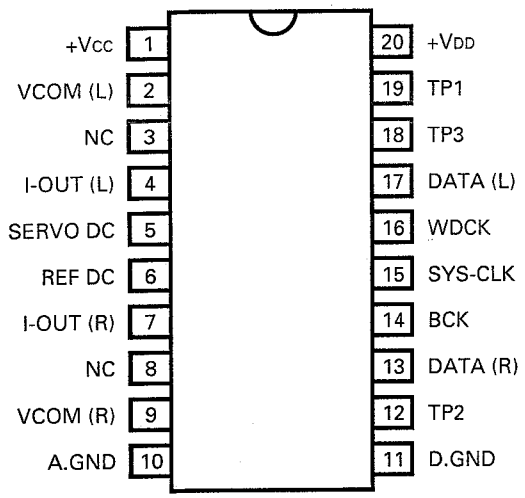
Pin No.	Pin name	I/O	Function
1	AINL+	I	Left-channel analog non-inverted input pin.
2	AINL–	I	Left-channel analog inverted input pin.
3	VREFIN	I	Reference voltage input pin. Normally connect to the VREF pin. The input range is 1.6 times the difference between VA+ and the voltage input to this pin.
4	VA+	–	Analog section analog power supply pin (+5V).
5	AGND	–	Analog section analog ground pin.
6, 7	NC	–	
8	TST1	–	Test pin. Open or connect to DGND.
9	SEL18	I	Output data length select pin (with pull down resistor). Low : 16 bits, High : 18 bits
10	PD	I	Power down pin. High : Power down mode. Offset calibration starts at a falling edge. When the power is turned on or the clock frequency is changed, calibration must be carried out.
11	TST2	–	Test pin. Open or connect to DGND.
12	CMODE	I	Master clock select pin. Low : CLK 256 fs (12.288MHz @fs : 48kHz), High : CLK 384 fs (18.432MHz @fs : 48kHz)
13	SMODE	I	Interface clock select pin. Set the input/output of each of the L/R̄, SCLK, and FSYNC clock pins. Low : Save mode (all input pins), High : Master mode (all output pins)
14	L/R̄	I/O	Input channel select pin. Slave mode : The fs clock is input. Lch MSB data is output at a rising edge and Rch MSB data is output at a falling edge of the clock signal. Master mode : The fs clock is output. SDATA is output one clock after the L/R̄ edge. High when the power is down (PD : High).
15	SCLK	I/O	Serial data clock pin. One bit of data is output at a falling edge of the clock. Slave mode : Normally a 32 to 64 fs clock is input. Master mode : A 64 fs clock is output. Low when the power is down (PD : High).
16	SDATA	O	Serial data output pin. Data is number two's complement and the MSB is output first. Goes low after 16/18 bits are output. Low when the power is down (PD : High).
17	FSYNC	I/O	Frame synchronization clock pin. Slave mode : SDATA output is enabled when the pin is high. Master mode : The 2 fs clock is output. High when 16-bit data is output. The two low-order bits are low when 18-bit output is selected. Low when the power is down (PD : High).
18	VDP+	–	Digital section power supply pin (+5V).
19	DGND	–	Digital section ground pin.
20	CLK	I	Master clock input pin. When CMODE is high, CLK : 384 fs. When CMODE is low, CLK : 256 fs.
21, 22	TST3, TST4	–	Test pin. Open or connect to DGND.

SEMICONDUCTOR DATA

Pin No.	Pin name	I/O	Function
23	NC	–	
24	VDB+	–	Digital section power supply pin (+5V). (Silicon PCB potential)
25	NC	–	
26	VREF	O	Reference voltage output pin (VA+) – 2.6V. Output based on VA+. Normally connect this output to the VREFIN pin.
27	AINR–	I	Right-channel analog inverted output pin.
28	AINR+	I	Right-channel analog non-inverted output pin.

DC/AC Converter : PCM69AU (TX-RX Unit IC34)

■ Terminal connection diagram



■ Terminal functions

Pin No.	Pin name	Function
1	+VCC	Analog Positive power supply
2	VCOM (L)	Lch V common

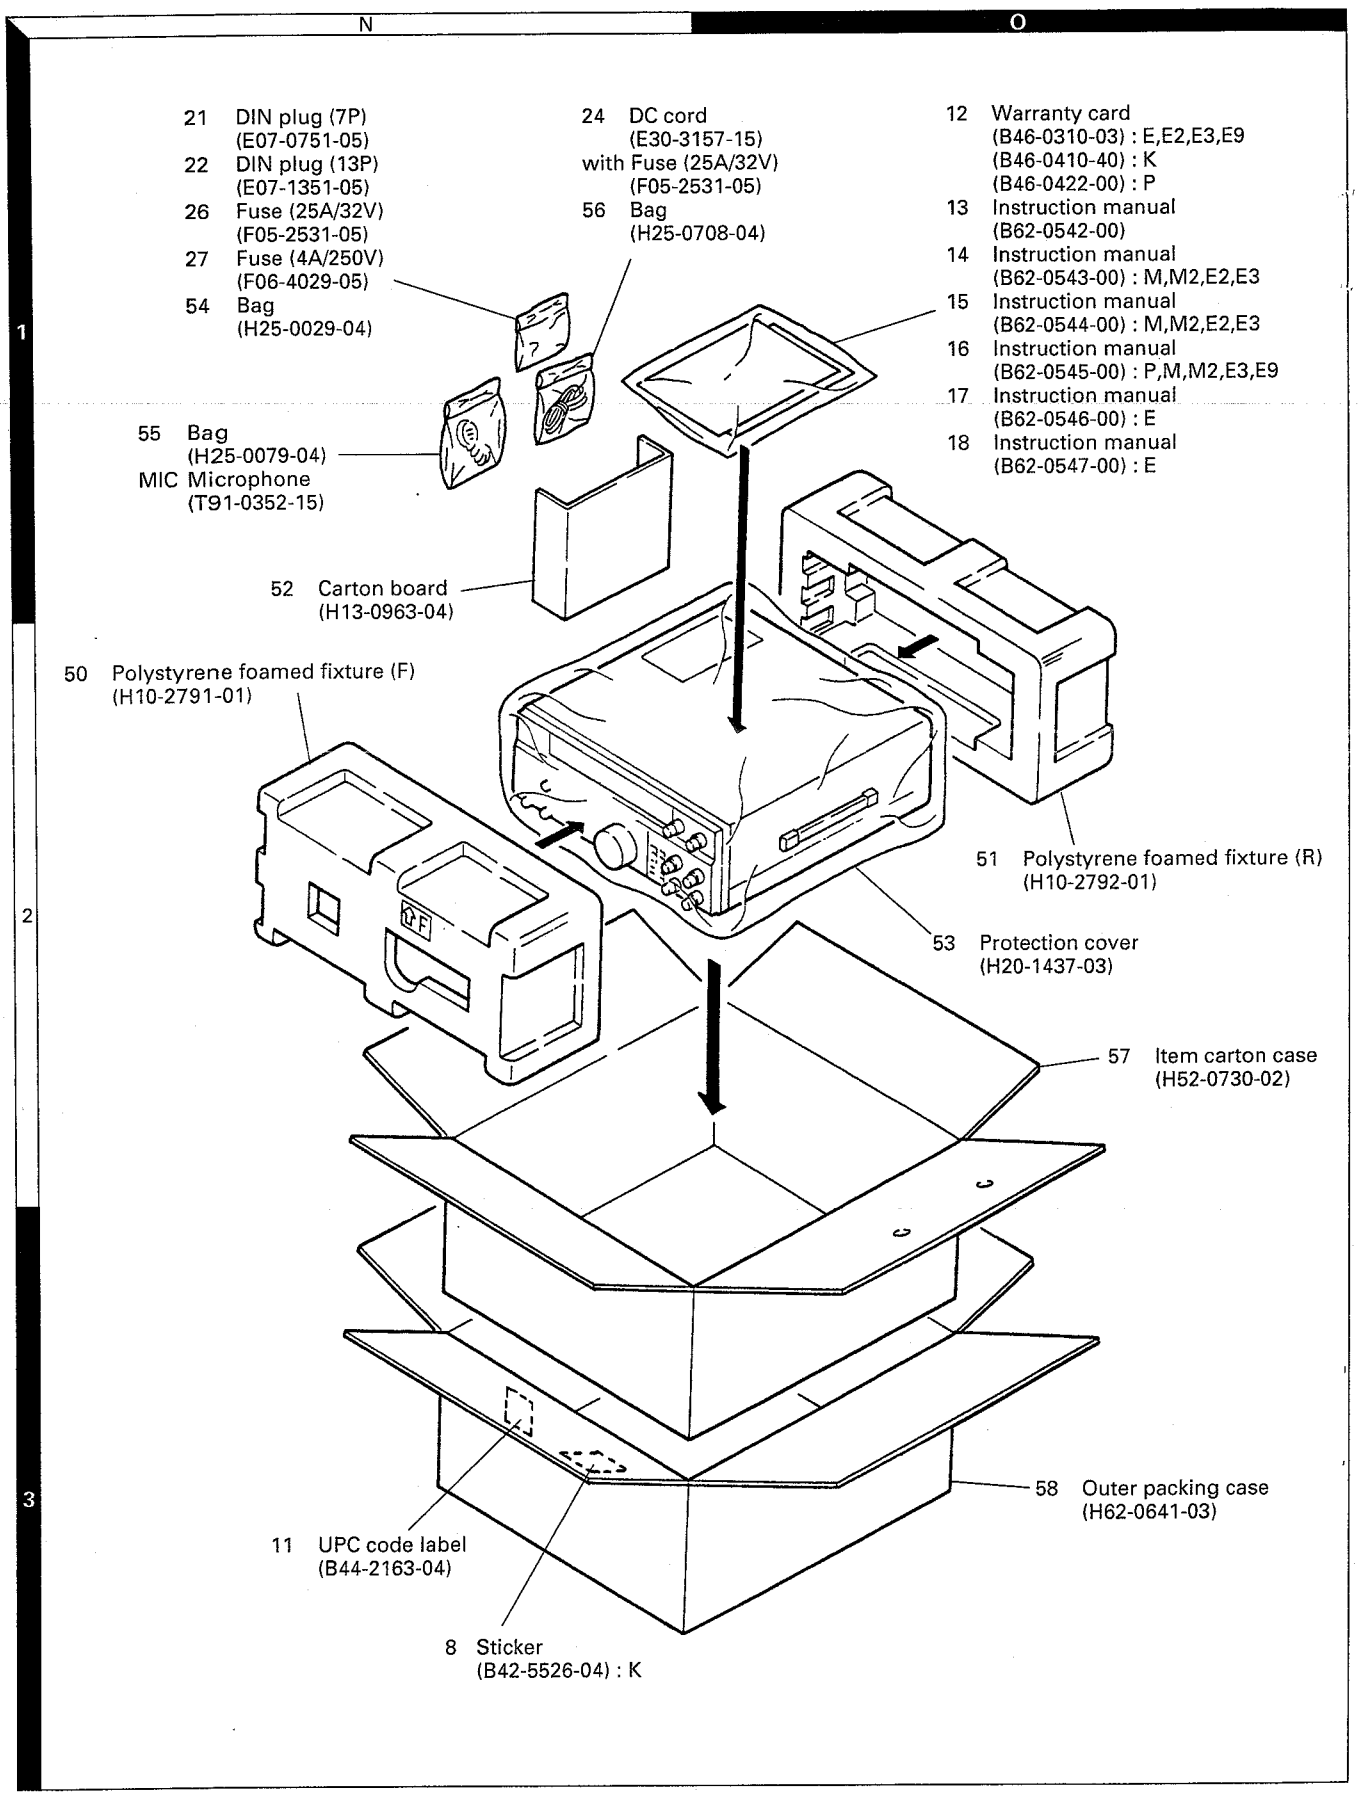
PACKING



ADJUSTMENT

Required Test Equipment

1. DC Voltmeter (DC V.M)
1) Input resistance : More than 1MΩ
2) Voltage range : 1.5 to 1000V AC/DC
Note : A high-recision multimeter may be used. However, accurate readings can not be obtained for high-impedance circuits.

2. DC Ammeter
1) Current range : 100mA, 1.5A, 15A, high-precision ammeter may be used.

3. RF VTVM (RF V.M)
1) Input impedance : 1MΩ and less than 3pF, min.
2) Voltage range : 10mV to 300V
3) Frequency range : 10kHz to 500MHz

4. AF Voltmeter (AF V.M)
1) Frequency range : 50Hz to 10kHz
2) Input resistance : 1MΩ or greater
3) Voltage range : 10mV to 30V

5. AF Generator (AG)
1) Frequency range : 200Hz to 5kHz
2) Output : 1mV or less to 1V, low distortion

6. AF Dummy Load (DM. SP)
1) Impedance : 8Ω
2) Dissipation : 3W or greater

7. Oscilloscope
Requires high sensitivity, and external synchronization capability (150MHz or greater).

8. Sweep Generator (Sweep G.)
1) Center frequency : 50kHz to 90MHz
2) Frequency deviation : Maximum ±35kHz
3) Output voltage : 100mV or greater

9. Standard Signal Generator (SSG)
1) Frequency range : 50kHz to 50MHz
2) Output : –133dBm/0.05μV to 7dBm/500mV
3) Output impedance : 50Ω
4) AM and FM modulation can be possible
Note : Generator must be frequency stable.

10. Frequency Counter (f. counter)
1) Minimum input voltage : 50mV
2) Frequency range : 150MHz or greater

11. Noise Generator (Noise G.)
Must generate ignition noise containing harmonics beyond 30MHz.

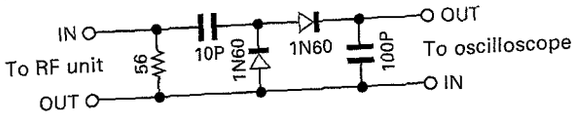
12. RF Dummy Load
1) Impedance : 150Ω and 50Ω
2) Dissipation : 150W or greater

13. Linear Detector
1) Frequency range : 30MHz

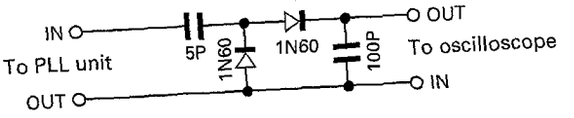
14. Power Meter
1) Impedance : 50Ω
2) Dissipation : 300W continuous or greater
3) Frequency limits : 60MHz or greater

15. Spectrum Analyzer
1) Frequency range : 100kHz to 110MHz or greater
2) Bandwidth : 1kHz to 3MHz

16. Detector
1) For adjustment of BPF



2) For adjustment of PLL/VCO BPF



17. Directional Coupler

18. Monitor Receiver
R-1000 class

19. Microphone
MC-43S or MC-60S8

20. Tracking Generator

21. Distortion Meter

22. Double Signal Pad (50Ω)

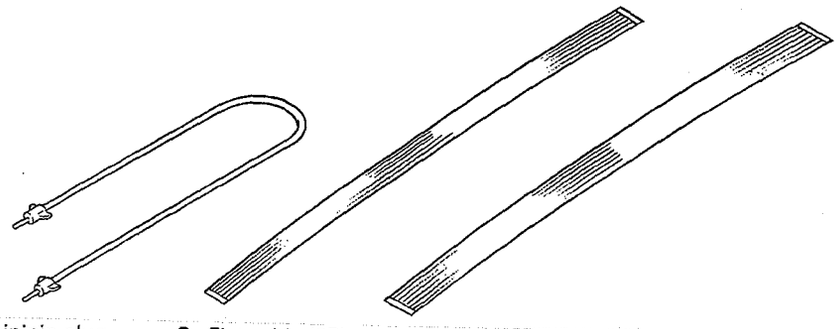
Service Jig

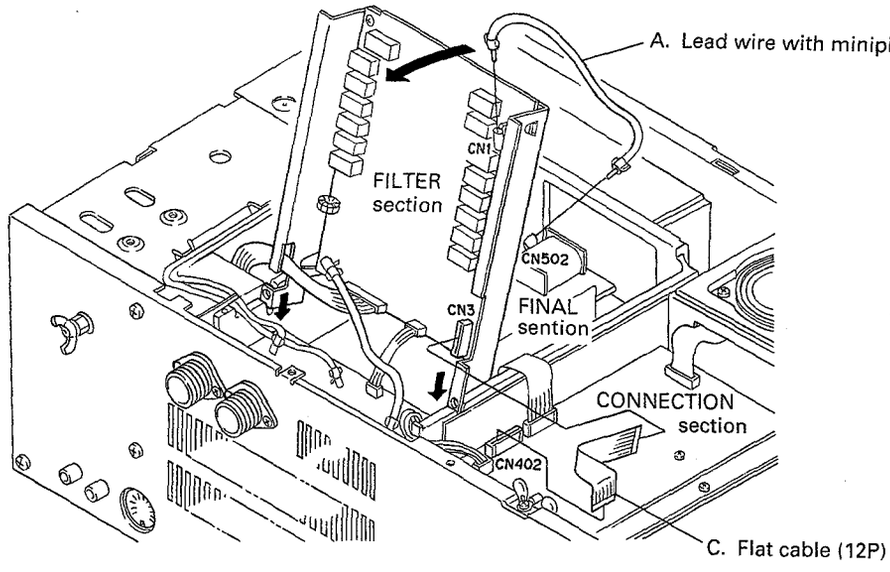


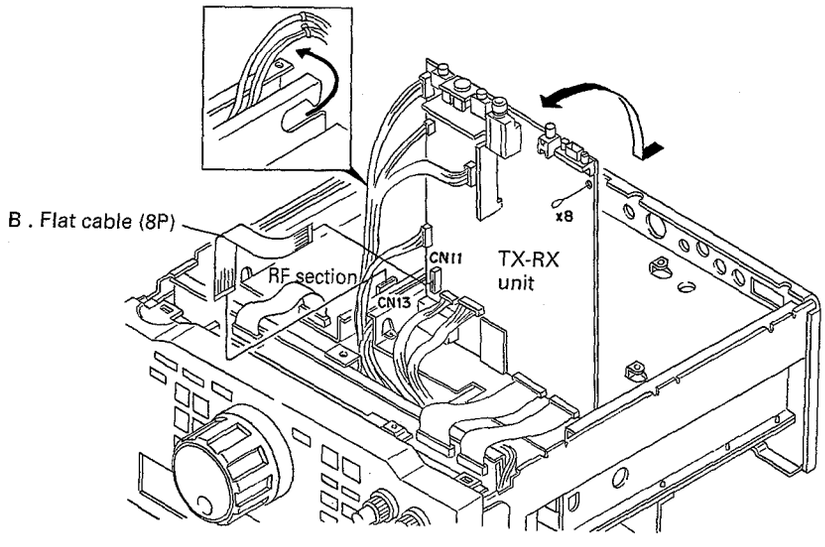
A. Lead wire with minipin plug
(E37-0064-05)
About 27cm

B . Flat cable (8P)
(E37-0581-05)
About 25cm

C. Flat cable (12P)
(E37-0580-05)
About 25cm

How to Use





TS-870S

ADJUSTMENT

Service Adjustment Mode

■ Outline

- The TS-870S is adjusted by the normal method and by another method using the service adjustment mode.
- In the adjustment mode, there are 28 menu numbers A0 to BB. All adjustment data items are saved in the EEPROM.
- When the service adjustment mode is entered, data is read from the EEPROM and placed in the CPU RAM so that settings can be modified.
- The EEPROM is updated only when data is written in Menu No. BA.
  Note : Transmission is possible in reception-related adjustment modes.

■ Operation procedure

1. Adjustment mode start
   Hold down the [N.R.] key and [LSB/USB] key, and turn the [POWER] switch ON to enter the adjustment mode. The menu number will appear in M. CH on the display.
2. Adjustment mode menu number selection
   When the [M. CH/VFO. CH] control is turned, the menu number changes.
3. Adjustment mode data writing
   Press the [UP]/[DOWN] key or the microphone [UP]/[DOWN] key in MENU No. BA.
4. Adjustment mode cancel
   When the [CLR] key is pressed, the normal memory-channel display returns.
   Note : If the power is switched OFF in the adjustment mode, it is canceled.

Service Adjustment Mode Menu

Menu No.	Adjustment function	Description
A0	System	Checksum display (Program version confirmation)
A1	ALC	ALC reference voltage adjustment
A2	S-meter (SSB)	Start level setting
A3		S9 level setting
A4		Full-scale level setting
A5	Filter	8.83MHz IF filter center frequency correction
A6		455kHz IF filter center frequency correction
A7	Power adjustment	100W adjustment (With power meter curve)
A8		50W adjustment (With power meter curve)
A9		25W adjustment (With power meter curve)
AA		10W adjustment (With power meter curve)
AB	TX gain	1.9MHz band
AC		3.5MHz band
AD		7MHz band
AE		10MHz band
AF		14MHz band
B0		18MHz band
B1		21MHz band
B2		24.5MHz band
B3		29MHz band
B4	ALC meter	Stare level setting
B5		Maximum zone level setting
B6		Full-scale level setting
B7	SWR protection	Protection operation setting
B8	SWR meter	VSWR=3 level setting
B9	FM	FM deviation setting
BA	System	Writing into EEPROM
BB	Display	All LCD segments light (Not light ON AIR lamp)

VCO2 (X58-3390-03)

TC1 : Lock voltage adj. (LO2A)

FINAL (X45-351X-XX) (A/5)

VR501,502 : Final base current

FILTER (X45-351X-XX) (B/5)

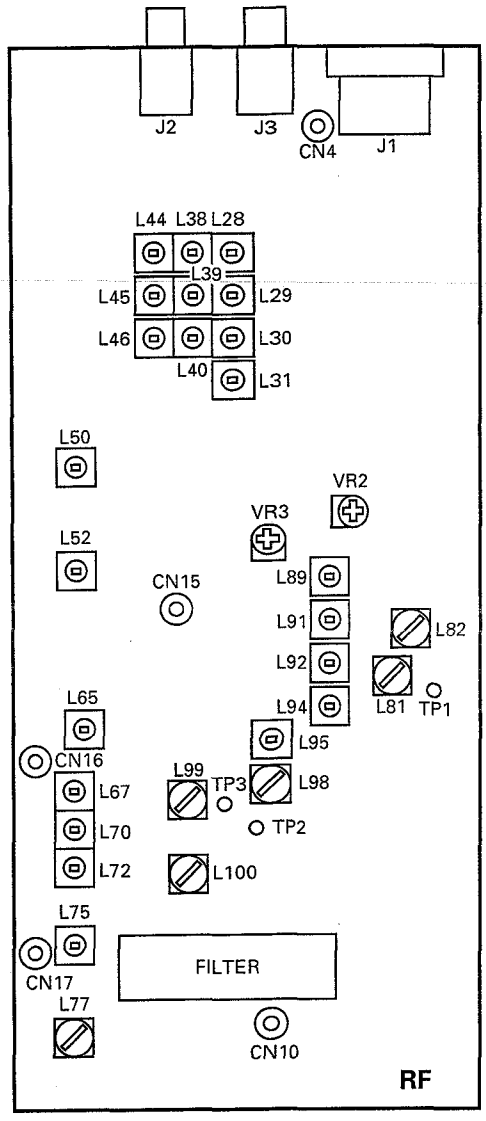
VR1 : ALC frequency response adj.
TC1 : NULL adj.

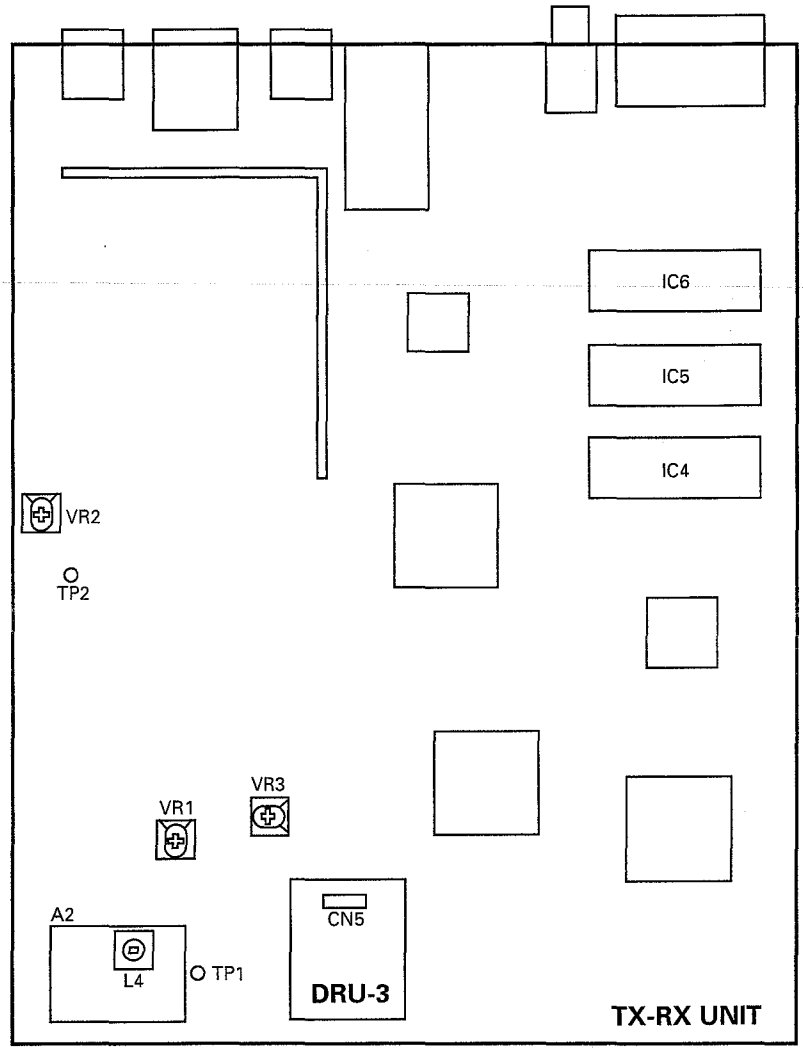
CONNECTION (X45-351X-XX) (C/5)

L451,452,458 : RX IF AMP adj.
L455~457 : TX IF AMP adj.

ADJUSTMENT

■ Lower view





RF (X44-3210-00) (A/9)

VR2	: Spurious adj.
VR3,L89,91,92,94,95,98,99	: TX IF AMP adj.
L28~31,38~40,44~46,50,52	: BPF adj.
L65,67,70,72	: MCF adj.
L75,77	: RX IF AMP adj.
L81,82	: NB adj.
L100	: TX MCF adj.

TX-RX UNIT (X57-4620-00)

VR1 : S-meter adj.
VR2 : AGC voltage adj.
VR3 : DRU-3 recording level adj. (Adjusted to the mechanical center)
L4 : DSP PLL lock voltage adj.

TS-870S

TERMINAL FUNCTION

CN No.	Pin No.	Name	Function
RF UNIT (X44-3210-00) (A/9) : RF			
CN2	Coaxial	RAT	RX signal
CN4	Coaxial	DRV	TX drive signal
CN5	Coaxial	LO1	1st local oscillation 73.08~103.05MHz
CN6	Coaxial	LO2A	2nd local oscillation 64.22MHz
CN7	1	TXB	TX 8V
	2	RXB	RX 8V
	3	AGC	AGC voltage
CN10	Coaxial	TR88	RX IF output/TX IF input 8.83MHz
CN13	1	SPO	Speaker signal
	2	CKY	Keying signal
	3	AGC	AGC voltage
	4	TXC	TX : "H"
	5	RXC	RX : "H"
	6	8A	Analog 8V
	7	14S	14V-switched
	8	GND	GND
CN14	1	15K	Filter selection 15kHz
	2	3K	Filter selection 3kHz
	3	6K	Filter selection 6kHz
	4	VSF	Forward wave detection voltage
	5	VSF	Reflected wave detection voltage
	6	ALM	ALC meter output
	7	THP	Thermal protection
	8	NC	
	9	UCK2	RF serial/parallel convert clock
	10	UDA2	RF serial/parallel convert data
	11	ENR1	RF serial/parallel convertor IC1 enable
	12	ENR2	RF serial/parallel convertor IC2 enable
	13	ENR3	DAC enable
	14	NC	
	15	RBK	RF blank signal
	16	–6	–6V
	17	GND	GND
	18	NC	
	19	SS	TX/RX control signal TX : "L"
	20	NC	
J1	1	SPO	Speaker signal
	2	COM	Relay common terminal
	3	SS	TX/RX control signal
	4	MKE	TX relay close
	5	BRK	TX relay open
	6	ALC	ALC input
	7	RL	13V output when TX
J2		EXT RX	External receiver output
J3		IF OUT	SM-230
RF UNIT (X44-3210-00) (B/9) : PLL			
CN500	1	GND	GND
	2	NFMT	FM modulation on/off signal (FM TX : "L")
	3	VB3	21.489~30MHz } VCO select signal
	4	VB2	14.489~21.489MHz } Active "H"
	5	VB1	7.489~14.489MHz }
	6	VB0	0~7.489MHz
	7	UNL	Unlock detection output (Unlock : "H")
	8	GND	GND
	9	PLE2	PLL2 enable signal (LO2A)
	10	PLE1	PLL1 enable signal (LO1)
	11	PCK	Clock
	12	PDA	PLL, DDS data
	13	14D	14V
	14	DLE3	DDS3 enable signal (LO4)
	15	DLE2	DDS2 enable signal (LO3)
	16	DLE1	DDS1 enable signal (LO1)
	17	TXC	PLL DDS latch select signal (TX : "H")
	18	GND	GND
	19	9P	9V
	20	5P	5V
CN501	1	GND	GND
	2	LO4	DDS3 output
CN502	Coaxial	LO3	DDS2 output (8.375MHz)
CN503	Coaxial	REF	Reference signal output for TX-RX unit (20MHz)
CN504	Coaxial	LO1	LO1 output (73.08~103.05MHz)
CN505	Coaxial	LO2A	LO2A output (64.22MHz)
CN506	1	FMD	FM modulation signal
	2	GND	GND
	3	GND	GND
RF UNIT (X44-3210-00) (D/9) : PHONE			
CN901	1	SPI1	Phone jack through
	2	SPG	GND
	3	SPO1	Phone jack output
RF UNIT (X44-3210-00) (E, F, G, H, I/9) : VR			
CN903	1	DGND	Digital GND
	2	VPWR	MIC/PWR VR 1
	3	VMIC	MIC/PWR VR 2
	4	VDLY	CAR/DELAY VR 1
	5	VCAR	CAR/DELAY VR 2
	6	5D	5V
CN904	1	DGND	Digital GND
	2	VMON	PROC/MONI VR 1
	3	VPRC	PROC/MONI VR 2
	4	VKEY	AGC/KEY VR 1
	5	VAGC	AGC/KEY VR 2
	6	5D	5V
CN905	1	NC	
	2	WENB	Width encoder B
	3	WENA	Width encoder A
	4	SENB	Shift encoder B
	5	SENA	Shift encoder A
	6	GND	GND
CN906	1	GND	GND
	2	VRF	AF/RF VR 1
	3	VAF	AF/RF VR 2
	4	RENA	RIT encoder A
	5	RENB	RIT encoder B
	6	5D	5V
CN907	1	GND	GND
	2	VSQL	NB/SQL VR 1
	3	VNB	NB/SQL VR 2
	4	CENA	M.CH encoder A
	5	CENB	M.CH encoder B
	6	5D	5V
FINAL UNIT (X45-351X-XX) (A/5) : FINAL			
CN501	Coaxial	DRV	Drive input (From RF)
CN502	Coaxial	PO	TX signal output (To FILTER)
CN503	1	14S	13.8V
	2	14S	13.8V
	3	TXB	TX 13.8V
	4	GND	GND
	5	GND	GND
CN504	1	14V	13.8V
	2	14V	13.8V
	3	GND	GND

TERMINAL FUNCTION

CN No.	Pin No.	Name	Function
W501	Board	14F	Power supply 13.8V connecting harness
	in	14F	Power supply 13.8V connecting harness
		GND	Power supply 13.8V connecting harness
		GND	Power supply 13.8V connect ing harness
FIANL UNIT (X45-351X-XX) (B/5) : FILTER			
CN1	Coaxial	PO	Filter input signal
CN2	Coaxial	ATO	TX output signal (To AT)
CN3	1	8A	8V
	2	GND	GND
	3	GND	GND
	4	14S	14V
	5	14S	14V
	6	UCK2	Shift register clock
	7	UDA2	Shift register data
	8	ENF1	Shift register enable
	9	DGND	Digital GND
	10	TXB	TX power 8V
	11	VSF	Forward wave detection voltage
	12	VSR	Reflected wave detection voltage
CN4	1	ATA	Make for AT through/on relay
	2	28AT	24.5~30MHz
	3	25AT	21.5~24.5MHz
	4	18AT	18.5~21.5MHz
	5	14AT	14.5~18.5MHz
	6	10AT	10.5~14.5MHz
	7	7AT	4.0~7.5MHz
	8	4AT	2.5~4.0MHz
	9	GND	GND
	10	14S	14V
	11	GND	GND
W1	1	RL	TX/RX select signal output
	2	ANTS	ANT 1/2 select signal output
	3	GND	GND
FINAL UNIT (X45-351X-XX) (C/5) : CONNECTION			
CN401	1	15K	455kHz filter select "L" : Filter on
	2	3K	455kHz filter select "L" : Filter on
	3	6K	455kHz filter select "L" : Filter on
	4	TT	External AT tuning control (Pass through)
	5	TS	External AT tuning control (Pass through)
	6	UCK2	Pass through
	7	UDA2	Pass through
	8	ENF1	Pass through
	9	VSF	Pass through
	10	VSR	Pass through
	11	THP	Pass through
	12	14D	14V
	13	14D	14V
	14	14V	14V
	15	14V	14V
	16	PWS	Power switch on : "H"
	17	9P	PLL power 9V
	18	5P	PLL power 5V
	19	-6	-6V output
	20	GND	GND
CN402	1	8A	8V
	2	GND	GND
	3	GND	GND

	3	AGND	Analog GND
	4	AGND	Analog GND
CN603	1	THP	Thermal protection on : "H"
	2	TXB	TX 13.8V
	3	14D	13.8V
	4	8D	Digital 8V
	5	14D	Digital 13.8V
	6	8A	Analog 8V
	7	GND	GND
	8	GND	GND
	9	14S	13.8V
	10	14S	13.8V

AT coil tap band data

TS-870S

TERMINAL FUNCTION

CN No.	Pin No.	Name	Function
	11	14S	13.8V
	12	PSW	Power switch on : "H"
	13	14V	13.8V
CN604	1	14S	13.8V
	2	14S	13.8V
	3	TXB	TX 13.8V
	4	GND	GND
	5	GND	GND
CN605	1	MOT+	Moter drive +
	2	MOT –	Motor drive –
FINAL UNIT (X45-351X-XX) (E/5) : RELAY			
CN301	1	RL	TX/RX select signal input
	2	ANTS	ANT 1/2 select signal input
	3	GND	GND
CN302	Coaxial	ATO	TX signal input (From FILTER)
CN303	Coaxial	RAT	RX signal output (To RF)
CN304	Coaxial	AT1	Input/output to AT (RX : Output, TX : Input)
CN305	Coaxial	AT2	Input/output to AT (RX : Input, TX : Output)
CN306	TP		ANT1 GND
CN307	TP		ANT2 GND
W301	TP		ANT1 signal line
W303	TP		ANT2 signal line
AT UNIT (X53-3340-02)			
CN1	Coaxial	AT1	AT input
CN2	Coaxial	AT2	AT output
CN3	1	VRE	+5V reference voltage for A/D
	2	POD2	VC2 position detection, VR101 output
	3	GND	GND
	4	POD1	VC1 position detection, VR102 output
CN4	1	NC	
	2	M2–	Motor 2 drive –
	3	M2+	Motor 2 drive +
	4	M1–	Motor 1 drive –
	5	M1+	Motor 1 drive +
CN5	1	NC	
	2	F15	Power line 11~14V
	3	GND	GND
CN6	1	ATA	Make for AT through/on relay "L" : On
	2	NC	
CN7	1	ATG	GND for discriminating that is connected to microcomputer
	2	SPED	Motor speed control pulse
	3	APRE	Control selection "H" : Preset type, "L" : Auto tuning type
	4	VRE	+5V reference voltage for A/D
	5	PR22	Motor 2 control signal
	6	PR21	Motor 2 control signal
	7	POD2	VC2 position detection
	8	PR12	Motor 1 control signal
	9	PR11	Motor 1 control signal
	10	POD1	VC1 position detection
	11	GND	GND
CN101	1	28AT	24.5~30MHz
	2	15AT	21.5~24.5MHz
	3	NC	
	4	18AT	18.5~21.5MHz
	5	14AT	14.5~18.5MHz
	6	10AT	10.5~14.5MHz
	7	7AT	4.0~7.5MHz
	8	4AT	2.5~4.0MHz

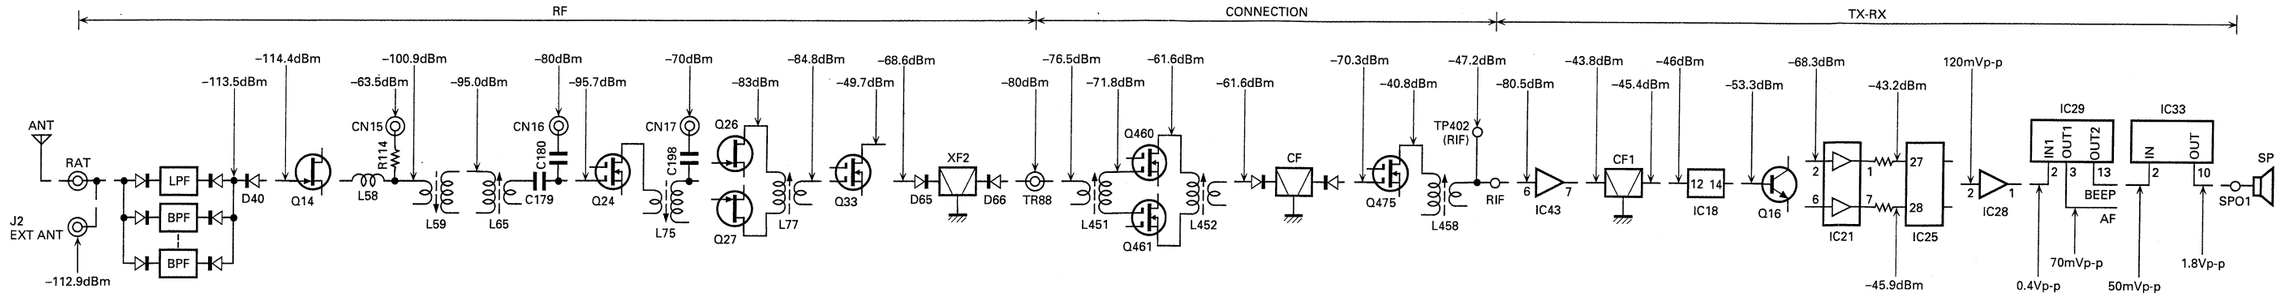
LEVEL DIAGRAM

Receiver Section

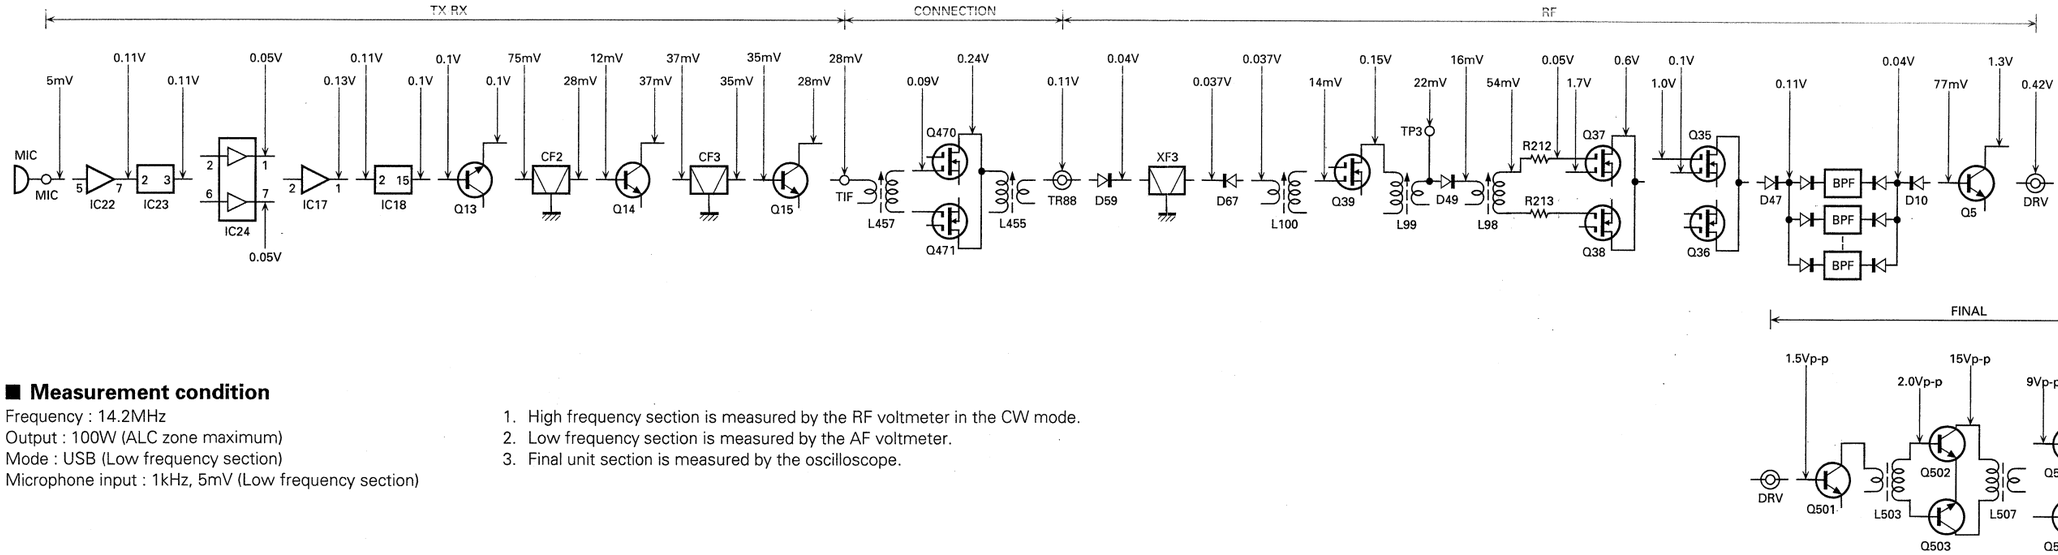


■ Measurement condition

Frequency : 14.2MHz
ANT input : –113dBm
AF output : 0.63V/8Ω, 1kHz

1. The figures shown are signal generator output required for a constant audio output with a constant AF gain control setting. Set the AF gain control for 0.63V/8Ω audio output at –113dBm signal generator input at 14.200MHz.
2. To measure signal generator output connect a 0.01μF capacitor between the signal generator and the check point.
3. AIP : OFF

Transmitter Section



■ Measurement condition

Frequency : 14.2MHz
Output : 100W (ALC zone maximum)
Mode : USB (Low frequency section)
Microphone input : 1kHz, 5mV (Low frequency section)

1. High frequency section is measured by the RF voltmeter in the CW mode.
2. Low frequency section is measured by the AF voltmeter.
3. Final unit section is measured by the oscilloscope.

TS-870S

DRU-3 (DIGITAL RECORDING UNIT)

Overview

The DRU-3 is an optional digital audio recording/playback unit for the TS-870S. It has the following features.

- Record transmit tone (main unit MIC input)
- Playback recording from the speaker or output as transmit modulation signal

Operation

■ Recording transmit tone (MIC input)

The microphone input signal from the DRM pin is input to IC904 (ISD2560GI) and recorded. The timing of each port is as follows.

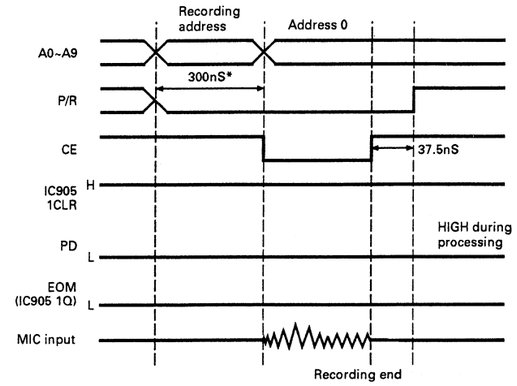
The input address is set by pins 1 (A0) to 10 (A9) of IC904 (ISD2560GI). When pin 27 (P/R) is LOW, the signal is recorded while pin 23 (CE) is LOW.

■ Playback as transmit signal

The record signal is played from pin 14 (SP+) of IC904 (ISD2560GI). The timing of each port is as follows.

The playback address is set by pins 1 (A0) to 10 (A9) fo IC904. When pin 27 (P/R) is HIGH, the signal is played back when pin 23 (CE) goes LOW. When playback ends, a LOW pulse is output from pin 25 (EOM). This pulse is latched by IC905 (TC74HC112AF), and pin 5 (1Q) of IC905 is kept HIGH. The microcomputer checks pin 5 of IC905, and pin 15 (1CLR) of IC905 is made LOW by the IC902 serial-to-parallel converter. Pin 5 of IC905 goes LOW and processing ends.

Recording transmit tone (MIC input)



Playback as transmit signal

	Supply voltage			DC 13.8V ± 15%
	Grounding method			Negative ground
	Current	Transmit (Max.)		20.5A
		Receive (No signal)		2A
	Usable temperature range			–10°C to +50°C (+14°F to +122°F)
	Frequency stability (–10°C to +50°C)			Within ±10PPM
	Frequency accuracy (At room temperature)			Within ±10PPM
	Dimensions [W x H x D] (Projections included)			330 x 120 x 334 mm/13.0 x 4.72 x 13.1 in (339 x 135 x 375 mm/13.3 x 5.31 x 14.8 in)
	Weight			Approx. 11.5kg (25lbs)
TRANSMITTER	Frequency range	160m band		1.8*1 to 2.0*2MHz
		80m band		3.5 to 4.0*3MHz
		40m band		7.0 to 7.3*4MHz
		30m band		10.1 to 10.15MHz
		20m band		14.0 to 14.35MHz
		17m band		18.068 to 18.168MHz
		15m band		21.0 to 21.45MHz
		12m band		24.89 to 24.99MHz
		10m band		28.0 to 29.7MHz
	Output power*5	SSB, CW, FSK, FM	Max.	100W
			Min.	20W or less
		AM	Max.	25W
			Min.	20W or less
	Modulation	SSB		Balanced
		FM		Reactance
		AM		Low level
	Spurious emissions			–60dB or less
	Carrier suppression			50dB or more
	Unwanted sideband suppression (Modulation frequency 1.0kHz)			50dB or more
	Maximum frequency deviation (FM)	Wide		±5kHz or less
		Narrow		±2.5kHz or less
	Transmit frequency characteristics (–6dB) (TX lower cutoff : 300Hz, TX bandwidth : 2.3kHz)			300 to 2600Hz
	XIT shift frequency range			±9.99kHz
	Microphone imppedance			600Ω

*1 1.81MHz : Europe, France, Holland; 1.83MHz : Belgium, Spain
*2 1.85MHz : Belgium, France, Holland, Spain
*3 3.8MHz : Europe, Belgium, France, Holland, Spain
*4 7.1MHz : Europe, Belgium, France, Holland, Spain
*5 Belgium, Spain : 10W fixed on 160m band

TS-870S

SPECIFICATIONS

	Item			Rating
RECEIVER	Circuit type			Quadruple conversion superheterodyne
	Frequency range			100kHz to 30MHz
	Intermediate frequency			1st : 73.05MHz, 2nd : 8.83MHz, 3rd : 455kHz, 4th : 11.3kHz
	Sensitivity	SSB, CW, FSK (At 10dB (S+N)/N)	100kHz to 500kHz	1μV or less
			500kHz to 1.62MHz*6	4μV or less
			1.62MHz*6 to 24.5MHz	0.2μV or less
			24.5MHz to 30MHz	0.13μV or less
		AM (At 10dB (S+N)/N)	100kHz to 500kHz	2μV or less
			500kHz to 1.62MHz*6	31.6μV or less
			1.62MHz*6 to 24.5MHz	2μV or less
			24.5MHz to 30MHz	2μV or less
		FM (At 12dB SINAD)	28MHz to 30MHz	0.25μV or less
	Selectivity	SSB Lo : 300Hz, Hi : 2600Hz		–6dB : 2.3kHz, –60dB : 3.3kHz
		CW Width : 200Hz		–6dB : 200Hz, –60dB : 450Hz
		FSK Width : 500Hz		–6dB : 500Hz, –60dB : 1000Hz
		AM Lo : 100Hz, Hi : 4000Hz		–6dB : 9kHz, –60dB : 12kHz
		FM Width : 14kHz		–6dB : 14kHz, –60dB : 18kHz
	Image rejection (1.8MHz to 30MHz)			80dB or more
	1st IF rejection (1.8MHz to 30MHz)			80dB or more
	Notch filter atteneuation			40dB or more
	RIT shift frequency range			±9.99kHz
	Squelch sensitivity	SSB, CW, FSK, AM	100kHz to 500kHz	2μV or less
			500kHz to 1.62MHz*6	20μV or less
			1.62MHz*6 to 30MHz	2μV or less
		FM	28MHz to 30MHz	0.25μV or less
	Audio output (8Ω, 10% distortion)			1.5W or more
	Audio output impedance			8Ω

*6 1.705MHz : Canada, U.S.A.
