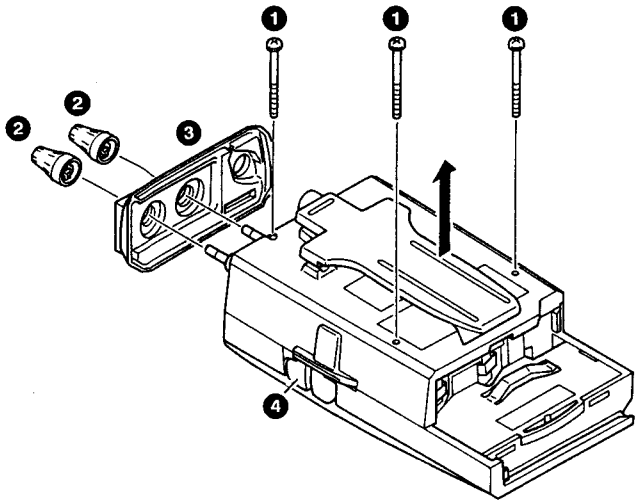
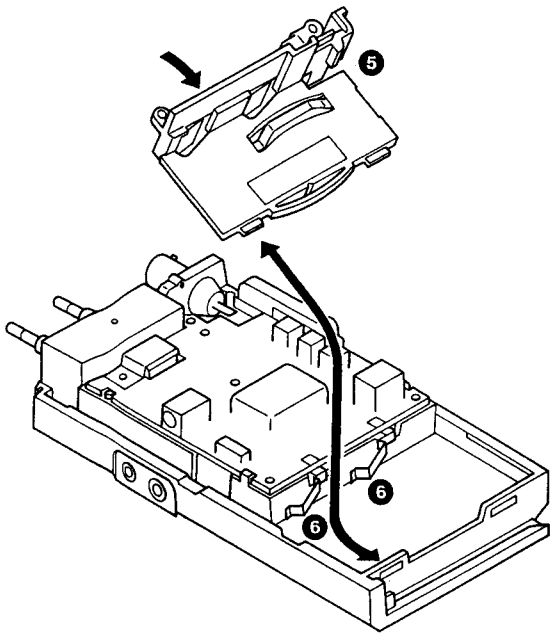
DISASSEMBLY FOR REPAIR

Removing the case.

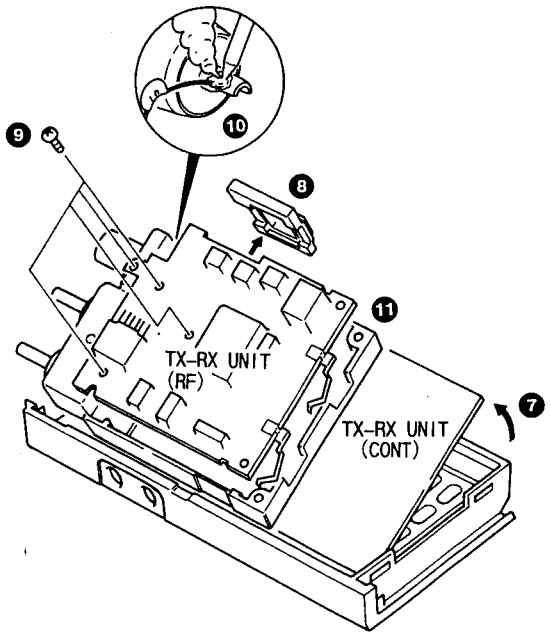
1. Remove the three long screws (❶) of the rear case. Then, remove the two knobs (❷), and remove the rubber panel (❸) while taking care not to give scar on it. Remove the rear case in the direction of the arrow. Remove the cap (❹) too.



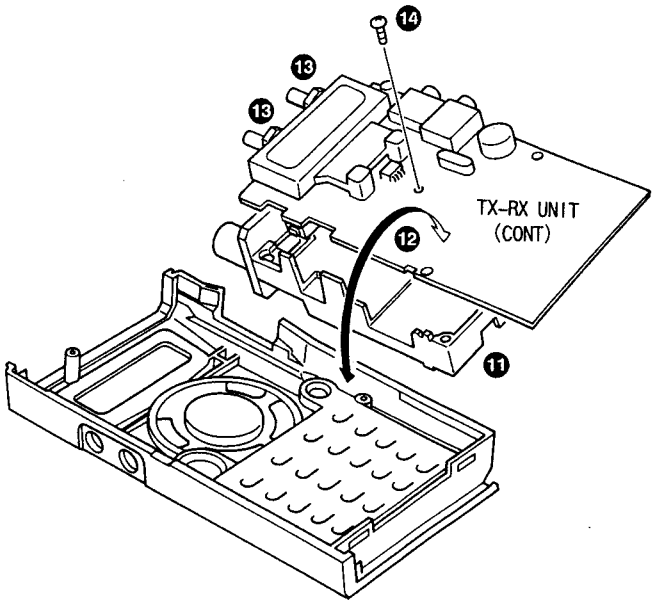
2. Remove the holder (❺) by lifting it up in the slanting upward direction while taking care not to bend the battery terminal (❻).



3. Remove the Chassis board while raising it in the direction of the arrow (❼).
   The knob (❽) is removed at the same time.
   The RF board can be removed from the chassis (❶❶) by removing the four screws (❾) and the soldering (❿).



4. Turn over the chassis board in the direction of the arrow (⓬).
   The Control board can be removed from the chassis (❶❶) by loosening the hexagon nut (⓭) and removing the screw (⓮).



TH-235A/E/234

CIRCUIT DESCRIPTION

FREQUENCY CONFIGURATION

The frequency configuration is shown in Figure 1 and Table 1.

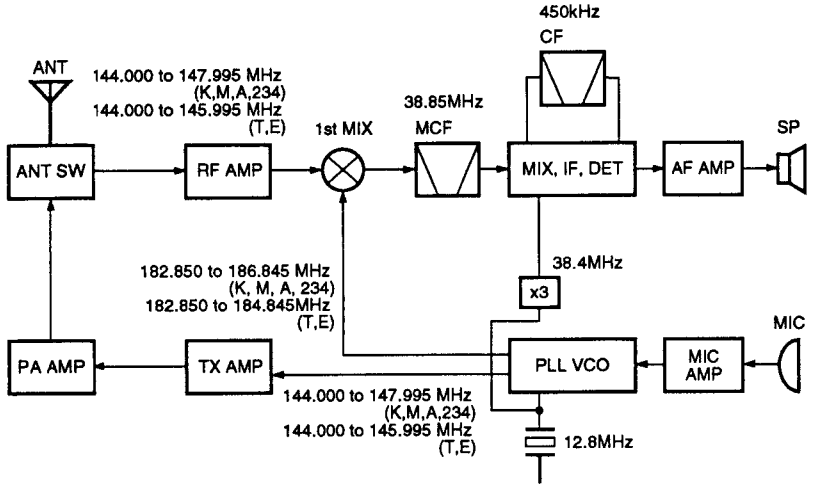


Fig. 1 Frequency configuration

Receiving system	Dobule superheterodyne system	
	First IF frequency	38.85MHz
	Second IF frequency	450kHz
Transmitting system	Direct conversion oscillating amplification system	
Modulation system	Variable reactance phase modulation	

Table 1 Basic configuration

RECEIVER SYSTEM

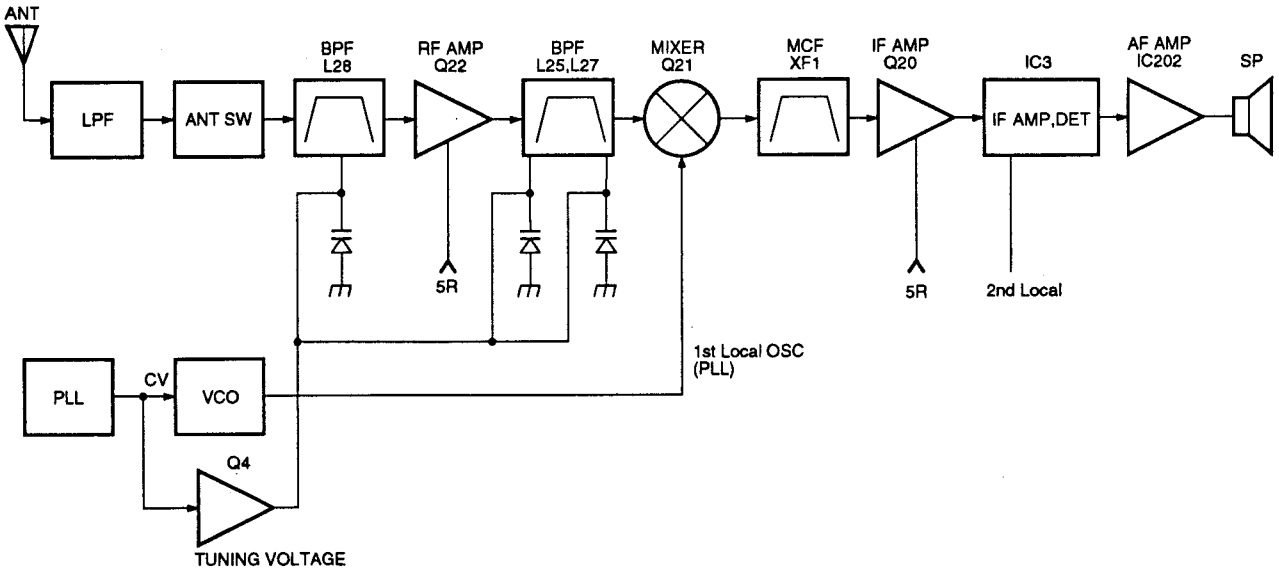

Fig. 2 Receiver section configuration

• RF amplifier

The signal from the antenna is passed through a low-pass filter and the transmission/reception selector circuit, and input to the RF amplifier.

The input signal is amplified by Q22. The unwanted frequency band of the signal is then eliminated by a band-pass filter.

This band-pass filter is a variable filter using a varicap, and operates so that it tunes to the receive frequency with the tuning voltage that is in proportion to the PLL lock voltage.

• First-stage mixer

The input signal is mixed with the first local oscillator output signal from the PLL circuit by the first-stage mixer Q21, producing a first IF signal. The unwanted frequency band of the first IF signal is eliminated by a two-stage monolithic crystal filters (MCF).

Item	Rating
Nominal center frequency (fo)	38.85MHz
Passband width	±7.5kHz more at 3dB
Attenuation band width	±25kHz less more at 40dB
Guaranteed attenuation	80dB or more at -910 kHz. Spurious : 20dB or more within ± 1MHz
Ripple	1dB or less
Insertion loss	3dB or less
Terminating impedance	500Ω/6pF

Table 2 MCF (L71-0491-05) characteristics (TX-RX unit XF1)

CIRCUIT DESCRIPTION

• IF amplifier

The first IF signal is amplified by Q20 and enters IC3 (FM signal processing IC) where it is mixed with the second local oscillator signal and so converted into the second IF signal. Here, the second local oscillator signal is generated by tripling the first local oscillator signal (12.8 MHz). The unwanted frequency band of the second IF signal is eliminated by ceramic filter CF1. The resultant signal is then amplified and detected.

Item	Rating
Center frequency of 6dB bandwidth(fo)	Within 450kHz±1.0kHz
6dB bandwidth	±7.5kHz or more
50dB bandwidth	±15kHz or less
Passband ripple	3dB or less
Guaranteed attenuation	45dB or more
Insertion loss	6dB or less
Input/output impedance	1.5kΩ

Table 3 Ceramic filter (L72-0944-05) characteristics (TX-RX unit CF1)

• AF amplifier

The frequency response characteristics of the audio signal output by the FM detector are corrected by the Q214 active high-pass filter and de-emphasis circuit consisting of R299 and C281.

The audio signal is then passed through an AF variable resistor and amplified by the power amplifier IC (IC202) to obtain the desired output.

• Squelch and mute circuit

The output signal which is detected by IC3 is input to the microprocessor analog port (pin-100) as the DC current. The input voltage to the microprocessor is A/D converted, and the microprocessor controls the MUTE, AFC0, and AFC1, thus controlling the audio signal. This port has hysteresis.

The microprocessor also controls the audio signal by controlling the MUTE, AFC0 and AFC1 during the CTCSS and DTSS operation modes.

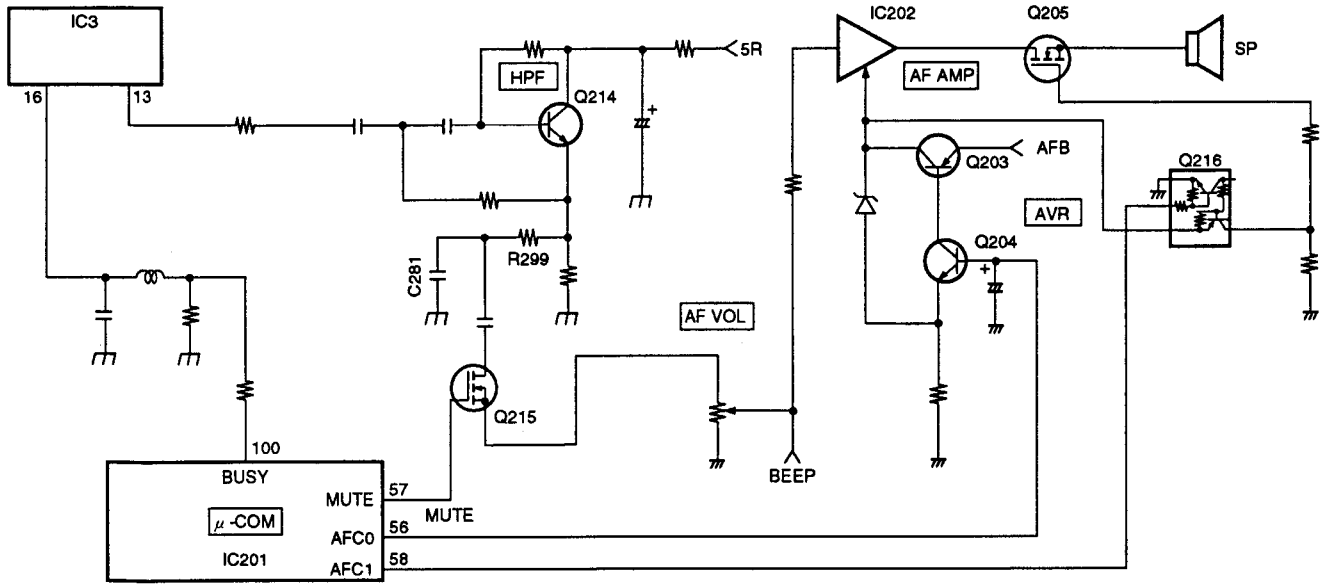

Fig. 3 AF amplifier, squelch and mute circuit

Conditions			MUTE	AFC0	AFC1
During transmission			L	L	L
During reception	Normal operation	When squelch is ON	L	L	L
		When squelch is OFF	H	H	H

MUTE : Muted when low.
AFC0 : Muted when low.
AFC1 : Muted when low.

Table 4 Mute operating conditions

TH-235A/E/234

CIRCUIT DESCRIPTION

TRANSMITTING SYSTEM

• Microphone amplifier

The audio band of the signal coming from the microphone is corrected by the 6 dB/octave pre-emphasis circuit consisting of C264 and R271. The 18 dB/octave tone frequency component is eliminated by the high-pass filter consisting of C259, R277, C267 and R282, and the pre-emphasis circuit. This signal is amplified and limited by IC208 (1/2). Distortion components exceeding the audio band of the resultant signal are then eliminated by a splatter filter consisting of IC208 (2/2), and R284 and C268 with 18 dB/octave frequency correction.

The thermistor TH201 performs the deviation correction caused by temperature change.

• Modulation circuit

The audio signal from the microphone amplifier passes through the modulation adjustment variable resistor VR202, is applied the VCO varicap diode D6, and is phase-modulated by variable reactance.

• Drive and final circuit

The desired signal is produced directly by the VCO, and amplified to about 75 mVrms by the buffer amplifier. It is then amplified to about 1.4 Vrms by the drive circuit. The amplified signal is input to the power transistor Q14.
The audio signal is power-amplified to about 5 W output by the power transistor Q14.

• Transmission/reception selector circuit

The transmission output signal is passed through the transmission/reception selector circuit and low-pass filter to the antenna.

The transmission/reception selector circuit consisting of D12 and D14 is turned on during transmission and off during reception for switching the output signal.

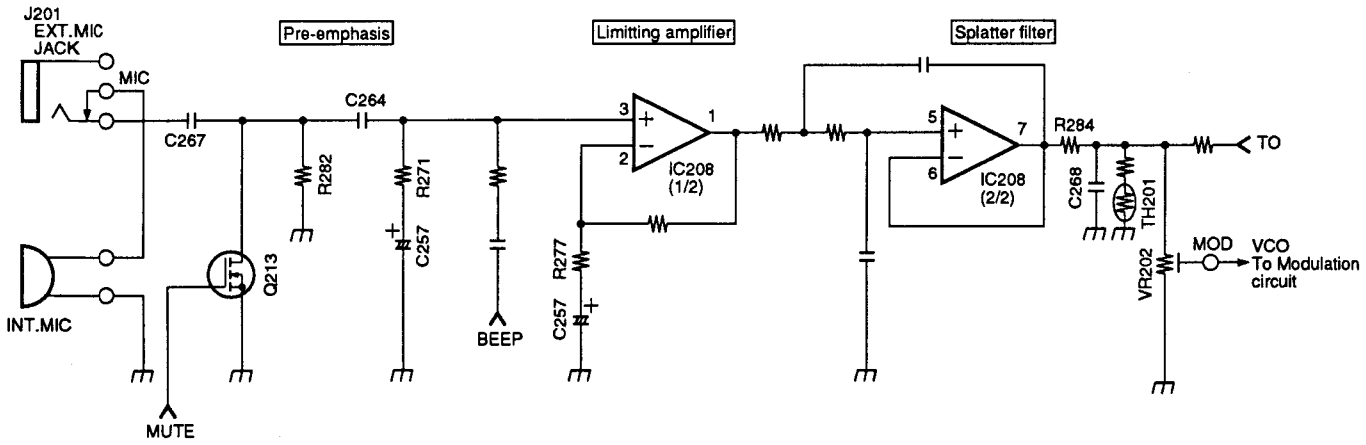

Fig. 4 Microphone amplifier

CIRCUIT DESCRIPTION

• APC and transmission output selector circuit

The automatic power control (APC) circuit is used to obtain a stable transmission current. This circuit detects the output power of the power transistor (Q14) and controls the APC voltage which then controls the transmission power.

The output amplitude of Q14 is rectified by D13 and D19, then compared with the reference voltage. Q16 forms a differential DC amplifier which controls the APC voltage that is generated by Q17 and Q18. This APC voltage controls the output of the drive amplifiers Q12 and Q13 to stabilize the transmission output power.

Either Hi power or the Low power of the transmission output is selected by the switch Q15 which changes the reference voltage.

• Temperature protection circuit

When the thermistor detects about 100°C, the temperature protection circuit turns Q23 on, reduces the APC voltage to prevent the drive amplifier and the power transistor from thermal breakdown.

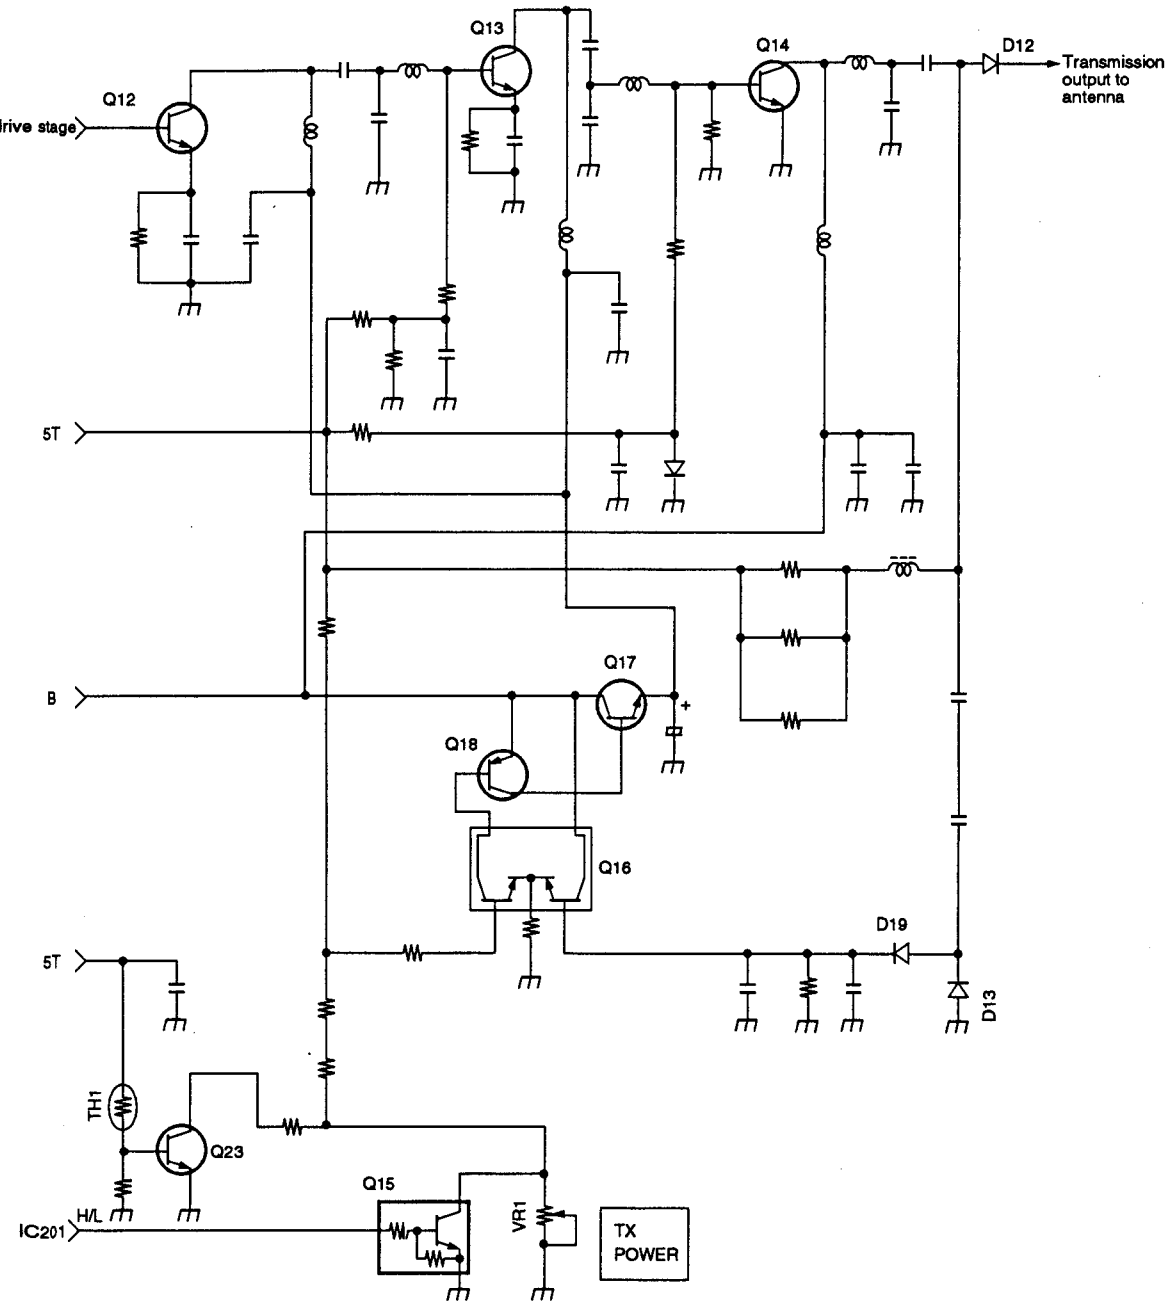

Fig. 5 APC circuit, transmission output selector circuit and temperature protection circuit

TH-235A/E/234

CIRCUIT DESCRIPTION

PLL CIRCUIT

• PLL

Output from the 12.8 MHz reference oscillator consisting of X1 is divided by IC1 to produce a 5 kHz or 6.25 kHz reference frequency. The comparison frequency is obtained by amplifying the VCO output by Q5 and dividing it by the PLL IC (IC1).

5, 10, 12.5, 15, 20, 25, 50 or 100 kHz PLL synthesizer is implemented by phase-comparing the reference frequency with the comparison frequency obtained by dividing X1.

The pulse output from pins-18 and -20 of IC1 according to the difference between the reference frequency and the comparison frequency is passed through the charge pump (Q2 and Q3), and is removed the ripple by a low-pass filter to produce the lock voltage.

The power supply of the charge pump is raised to about 10 V from 5C by the DC-DC converter.

• VCO

The Colpitts oscillator using Q7 (FET) directly oscillates the desired frequency. The oscillating frequency is changed by applying the lock voltage to the varicap diodes D4 and D5. The T/R line goes "Low" during transmission. Q6 and D7 are turned off to change over the oscillating frequency.

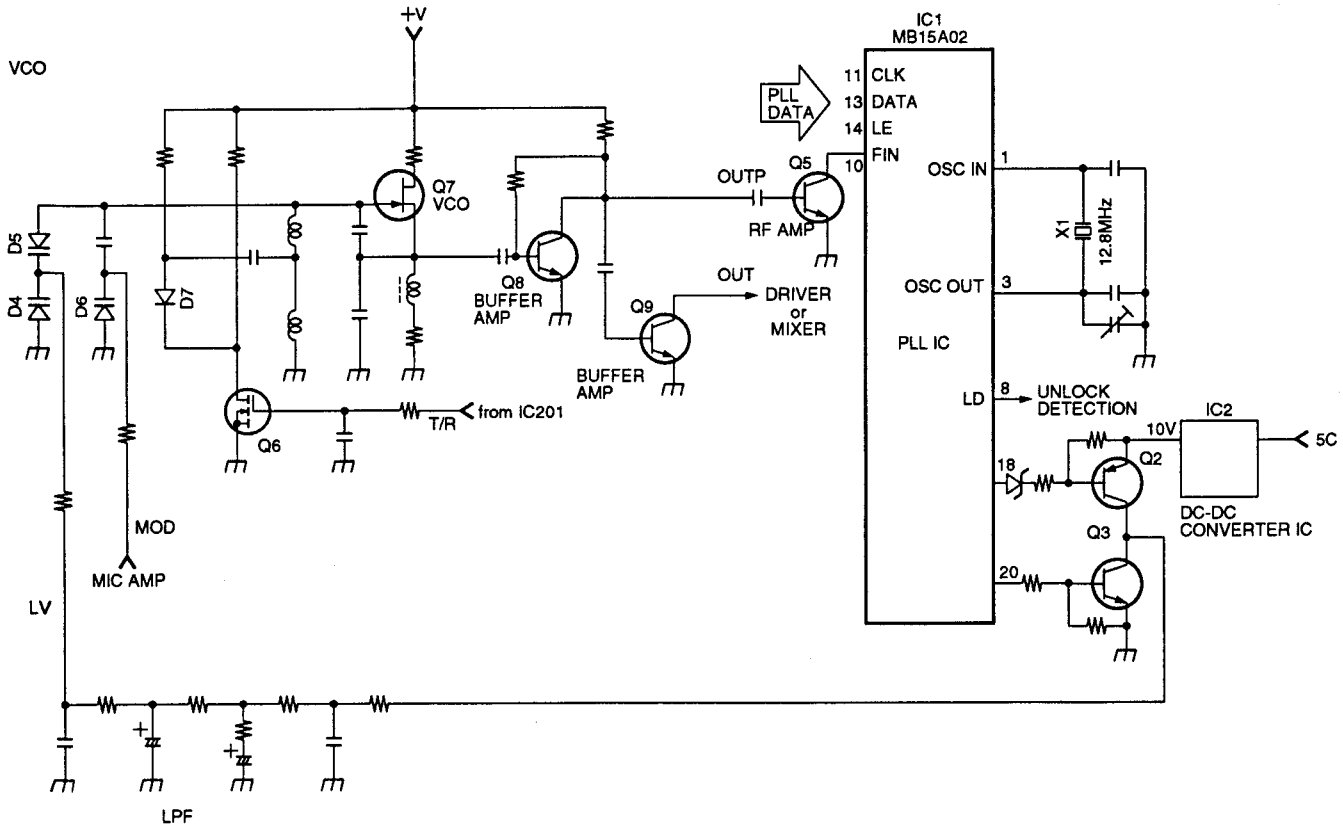

Fig. 6 PLL and VCO circuit

• Unlock detection circuit

When the PLL is unlocked, the output pulse from the LD pin (pin-8) of IC1 is waveform-shaped by D3, C5, R3 and C132 to set the LD terminal to the "High" level. The microprocessor monitors the voltage at the LD pin to control the transmission or reception selection timing.

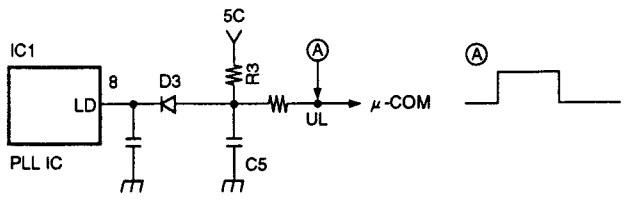

Fig. 7 Unlock detection circuit

CIRCUIT DESCRIPTION

DIGITAL CONTROL CIRCUIT

• Keys and rotary encoder circuit

The signals from the keys and rotary encoder are directly input to the microprocessor as shown in Figure 8.

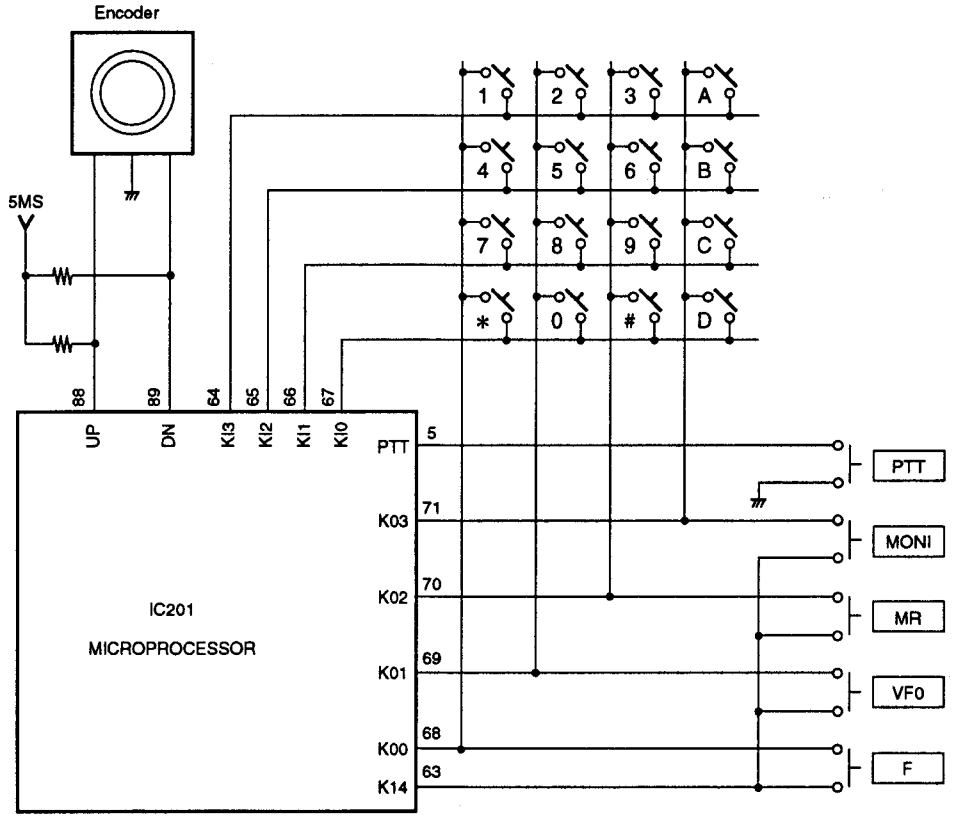

Fig. 8 Keys and rotary encoder circuit

CIRCUIT DESCRIPTION

• Reset and backup circuit

When the MB is turned on, a "High" level pulse resets the microprocessor (IC201). When the MB is turned off, the voltage detection IC (IC207) detects a 5M voltage drop and sets the output from "High" to "Low". When the microprocessor port INT goes "Low", the microprocessor outputs data to IC205 (EEPROM) and enters the backup mode. The EEPROM receives data while C232 is discharging and the data is internally written.

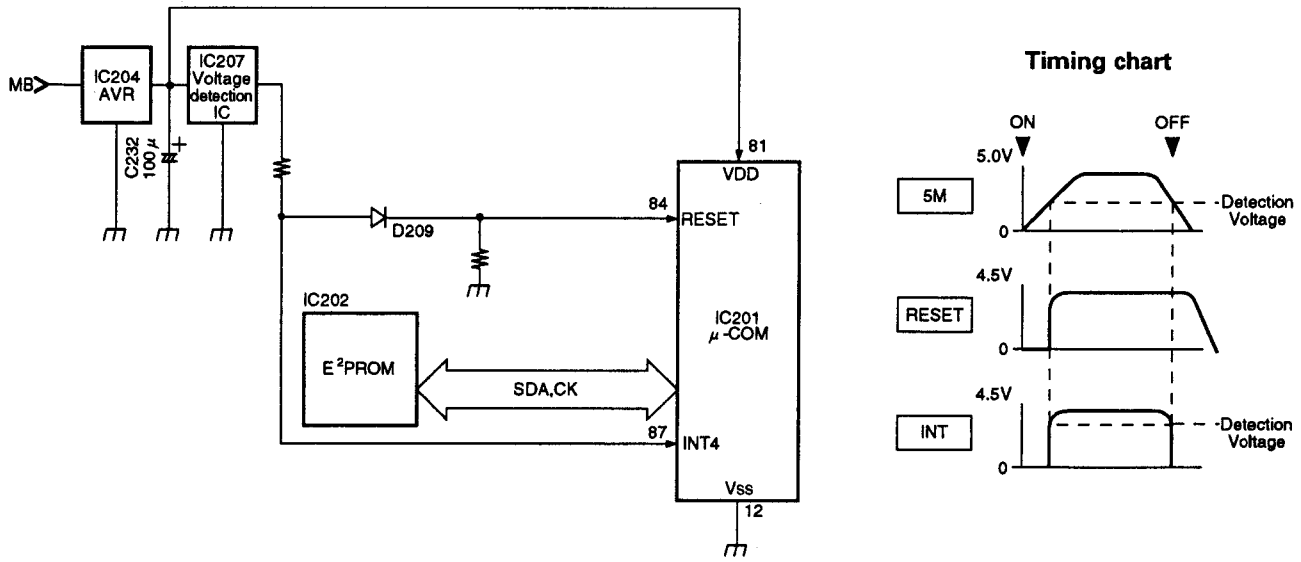

Fig. 9 Reset and backup circuit

• Battery voltage detection circuit

The power supply voltage is divided and input to the analog port (pin-2) of the microprocessor. When the input voltage is over 18V. "dCErr" message appears on display and warning sound beeps.

• Lamp circuit

When the microprocessor port LAMP goes "High" level, Q201 is turned on which turns on the LED.

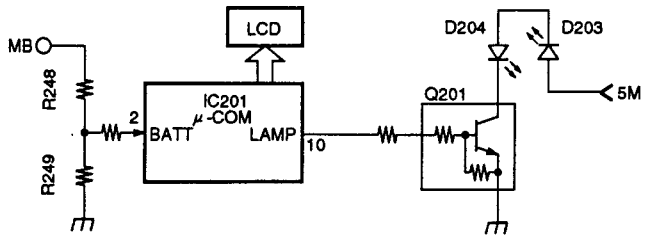

Fig. 10 Battery voltage detection circuit and lamp circuit

CIRCUIT DESCRIPTION

POWER SUPPLY CIRCUIT

• Nickel-cadmium battery charging circuit

The constant current circuit consisting of Q1 and D1 supplies the constant current of about 70 mA to the Nickel-cadmium battery from the external power supply connected to the DC IN pin. The constant current circuit does not work if any external power supply is connected to the DC IN pin.

• Power selector circuit

Configuration of the power supply circuit is shown in Figure 11. The power is distributed as shown.

- B — Power supply voltage of APC circuit and Q14
- AFB — Power supply voltage of AVR of the AF amplifier
- MB
  - 5M — VDD of IC201 (microprocessor), VDD of IC205 (EEPROM), VDD of IC207 (voltage detection), POWER switch and reference voltage of 5T and 5C
  - 5MS — VDD of IC203 (DTMF decoder IC), and reference voltage of 5T and 5C
- RB
  - 5C — VDD of Q8 and Q9 (VCO buffer amplifier), VDD of CTCSS, VDD of IC2 (DC-DC converter) and VDD of IC1 (PLL IC)
    - 5R — VDD of IC3 (FM IC) and VDD of receiver stage
  - 5T — VDD of IC208 (microphone amplifier), VDD of drive stage, bias voltage of protection circuit, and switch of D12 and D14 (transmission/reception selector switch)

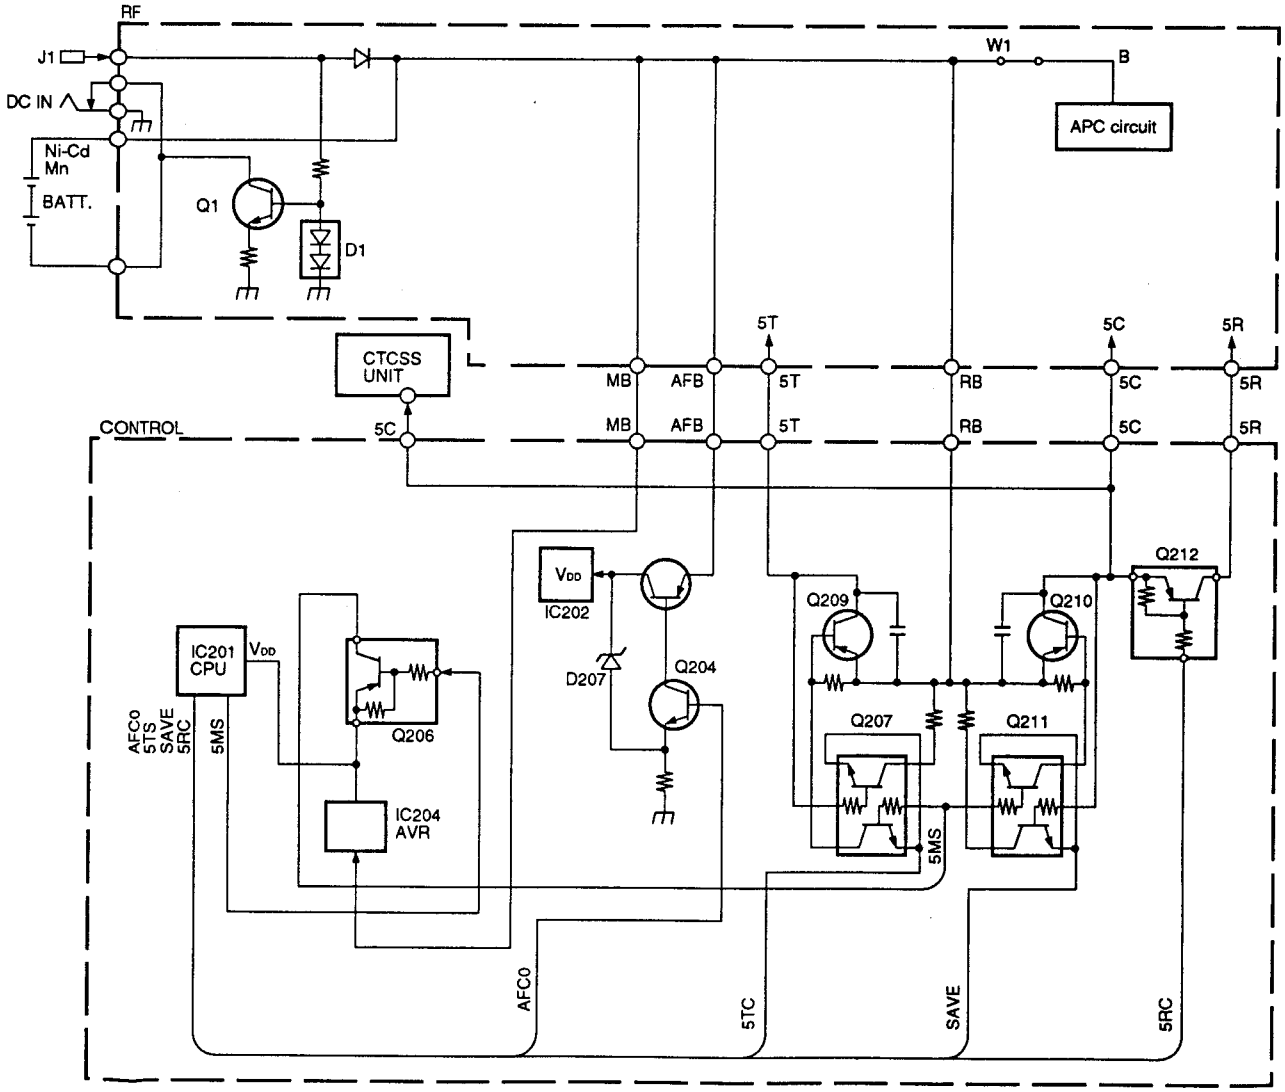

Fig. 11 Power supply circuit

TH-235A/E/234

CIRCUIT DESCRIPTION

• Battery save circuit

The power circuit enters the battery save mode if no key is pressed for 10 seconds or more while the squelch is switched in during reception state (SCAN OFF).

In the battery save mode, the output signal from the SAVE pin of the microprocessor turns Q211 on and off with the on/off ratio of about 200 ms vs. about 800 ms (on/off ratio of about 200 ms vs. about 125 ms when the DTSS function and paging function are turned on.) As the result, power consumption in the standby state is reduced by controlling the 5C AVR consisting of Q210 which turns 5R on and off.

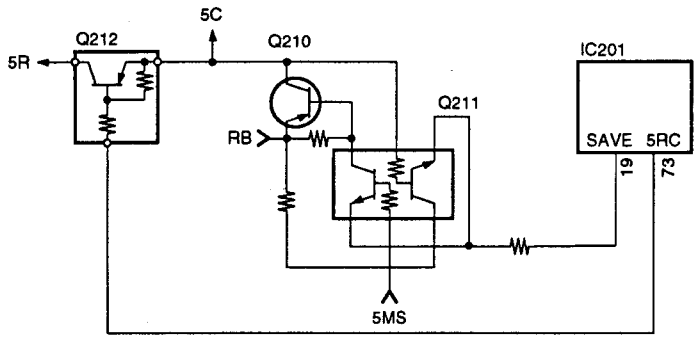

Fig. 12 Battery save circuit

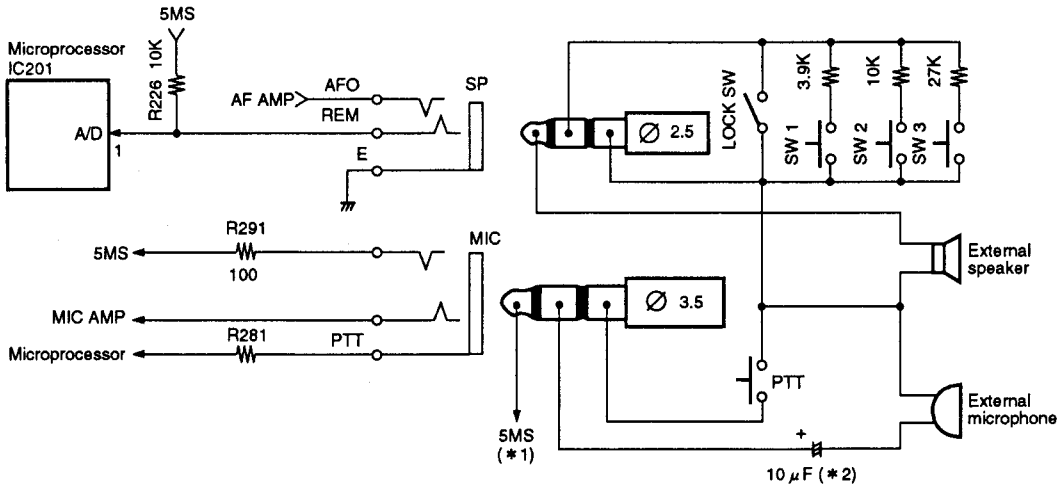
• Remote control circuit

The remote control operation corresponding to the input digital voltage connected to the A/D pin, is performed by the remote control circuit.

The voltage at the A/D pin is normally maintained to about 5 V by means of R226. When the microphone button of the remote control unit is pressed, this voltage is changed to the voltage value divided by the resistor connected in series with the switch pressed and R226. The resultant voltage indicates which button is pressed.



*1 : Voltage appears from the internal 5MS line (5 V) via R291. It is about 4.5 V when 5 mA flows.

*2 : The capacitor is not necessary in the following cases: Make a direct connection.
When a capacitor to cut the DC voltage is connected to the external device.
When a two-terminal capacitor microphone is used as the external microphone.

Fig. 13 Speaker, microphone jack and remote control circuit

CIRCUIT DESCRIPTION

SUPPLIED CIRCUIT

• CTCSS

The tone frequency is set by the serial data from the microprocessor (IC201). The audio signal is input from the CI pin of the detection output.

When the tones agree, the SDO pin is set to "Low" level. The microprocessor monitors the SDO pin and makes the judgment to control the MUTE, AFC0 and AFC1 pins.

During the CTCSS signal transmission mode, the CTCSS signal is output from the microprocessor through a low-pass filter and modulated.

• DTSS

Input and output of the DTMF code is controlled by the serial data from the microprocessor. The audio signal is input from the CI pin as in the CTCSS. When the DTMF signal is detected, the data is sent to the microprocessor. The microprocessor judges if the codes agree. The MUTE, AFC0 and AFC1 pins are controlled in accordance with the result of the judgment.

During transmission of the DTMF signal, the DTMF signal is output from the microprocessor. The DTMF signal is modulated after passing through the microphone amplifier.

The MUTE pin goes "Low" level during transmission of the DTMF signal which mutes the MIC audio signal. At the same time, AFC0 and AFC1 are turned on enabling monitoring the DTMF signal from the SP.

DESCRIPTION OF COMPONENTS

TX-RX Unit (X57-5260-XX)

O-11 : K, K2 O-51 : T, E, E3, E4 O-21 : M, M2, M3, A

Ref. No.	Use/Function	Operation/Conditions/Compatibility
IC1	PLL IC	
IC2	DC • DC converter	Outputs abt. twice the input voltage (5V).
IC3	FM IC	Second mixer, quadrature detector, AF output & noise amplifier output
IC201	Microprocessor	
IC202	AF power amplifier	
IC203	DTMF receiver	
IC204	5V AVR	
IC205	E^2PROM	
IC207	Voltage detection	
IC208	Microphone amplifier	Limiting amplifier, active low-pass filter
Q1	Constant-current circuit	Active when the Ni-Cd battery is charged.
Q2, Q3	Charge pump	
Q4	DC buffer amplifier	
Q5	RF amplifier	PLL IC, 10-pin IN (fin amplifier)
Q10	Ripple filter	
Q11	RF power amplifier	First stage of driver
Q12	RF power amplifier	
Q13	RF power amplifier	Final stage of driver
Q14	Transmitter power amplifier	
Q15	Transmitter power changeover SW	
Q16	APC differential DC amplifier	See the description of the APC circuit and transmitter switching circuit given in the Circuit Description section.
Q17, Q18	APC voltage control circuit	See the description of the APC circuit and transmitter switching circuit given in the Circuit Description section.
Q19	Local signal frequency tripler	Triples the input frequency of 12.8MHz to obtain the second local signal.
Q20	IF amplifier	MCF post amplifier
Q21	First mixer	144MHz band → 38.85MHz band
Q22	RF amplifier	144MHz first stage of receiving
Q23	Temperature protector	
Q201	Lamp switch	
Q203	AVR	AF amplifier power supply
Q204	Error amplifier	Q203 bias control
Q205	Mute switch	Receiver aural signal turns ON when this switch is positioned at "H".
Q206	5M SW	5M SW "L" : ON
Q207	5T SW	Q209 output control
Q209	AVR	5T
Q210	AVR	5C
Q211	5C SW	Q210 output control
Q212	5R SW	5R output control
Q213	Mute switch	Receiver aural signal turns OFF when this switch is positioned at "H".
Q214	Active high-pass filter	
Q215	Mute switch	Receiver aural signal turns ON when this Mute switch is set at position "H".

DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Conditions/Compatibility
Q216	AF amplifier power SW	ON when this switch is positioned at "L".
D1	Constant-voltage circuit	
D2	Reverse-current protector	
D3	Waveform shaper	
D8	Quick charger	5C ripple filter
D10	RF SW	ON at sending
D11	Q14 protection diode	
D12, D14	Transmit-receive ON-OFF SW	ON at sending; OFF at receiving
D13, D19	APC circuit	
D15	Startup diode	Double voltage generator for IC2
D16, 17, 18	Receive shift	
D20, D24	Reverse-current protector	
D201, 202	Reverse-current protector	
D203, 204	LED	LAMP
D207	Constant-voltage circuit	AF amplifier power supply
D208, 209	Reverse-current protector

TERMINAL FUNCTION

TX-RX Unit: RX ⟷ TX-RX Unit: Control

Connector	Pin No.	Pin name	Function
CN2, 201	1	EP	PLL IC enable signal
	2	UL	PLL unlock signal
	3	DT	Serial data signal
	4	CK	Clock signal
	5	5T	Power supply for Transmitting
	6	E	Ground
	7	BUSY	Squelch control signal
	8	E	Ground
	9	M0D	Modulation signal
	10	5R	Power supply for receiving
	11	H/L	Tx power switching signal
	12	E	Ground
	13	E	Ground
	14	T/R	VCO Transmit-receive switching signal
	15	E	Ground
	16	AFB	AF power amplifier supply voltage
	17	5C	PLL IC & VCO power supply
	18	MB	5C/5T/5R supply voltage
	19	AF0	Receiving audio signal
	20	RB	5M supply voltage

TX-RX Unit: Control ⟷ TSU-8 (optional)

Connector	Pin No.	Pin name	Function
CN203	1	CK	Clock signal
	2	DT	Serial data signal
	3	ET	TSU-8 enable signal
	4	NC	
	5	SDO	Tone match discriminating signal
	6	E	Ground
	7	3M	TSU-8 power supply
	8	CI	Signaling AF signal

TH-235A/E/234

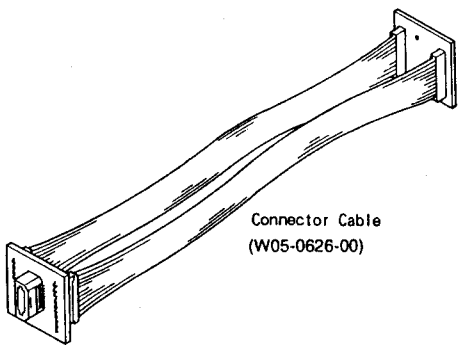
ADJUSTMENT

Required Test Equipment

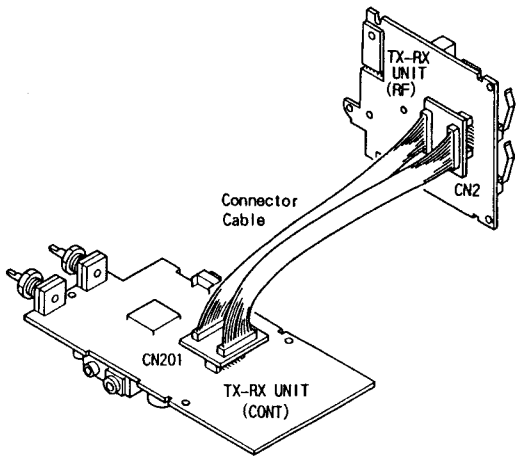
1. **Stabilized Power Supply**
   1)The Supply voltage can be changed between 5V and 18V, and the current is 3A or more.
   2)The standard voltage is 13.8V (DC IN) 12.0V (BATTERY TERMINAL).
2. **DC Ammeter (DC.A)**
   1)Class 1 ammeter (17 renges and other features).
   2)The full scale can be set to either 300mA or 3A.
   3)A cable of less internal loss most be used.
3. **Frequency Counter (f.counter)**
   1)Frequencies of up to 500MHz or so can be measured.
   2)The sensitivity can be changed to 250MHz or below, and measurements are highly stable and accurate (0.2ppm of so).
4. **Power Meter**
   1)Measurable frequency : Up to 500MHz.
   2)Impedance : 50Ω, unbalanced.
   3)Measuring range : Full scale of 10W or so.
   4)A standard cable (5D2W 1m) must be used.
5. **RF VTVM (RF V.M)**
   1)Measurable frequency : Up to 500MHz or so.
6. **Linear Detector**
   1)Measurable frequency : Up to 500MHz.
   2)Characteristics are flat, and CN is 60dB or more.
7. **Digital Voltmeter (DVM)**
   1)Voltage range : FS = 18V or so.
   2)Input resistance : 1MΩ or more.
8. **Oscilloscope**
   1)Measuring range : DC to 30MHz.
   2)Provides highly accurate measurements for 5 to 25MHz.
9. **AF Voltmeter (AF V.M)**
   1)Measurable frequency : 50Hz to 1MHz.
   2)Maximum sensitivity : 1mV or more.
10. **Spectrum Analyzer**
    1)Measuring range : DC to 1GHz or more.
11. **Standard Signal Generator (SSG)**
    1)Maximum frequency : 500MHz or more.
    2)Output : 0.05μV/–133dBm to 0.1V/–7dBm.
    3)Output impedance : 50Ω
12. **Tracking Generator (TG)**
    1)Center frequency : 50kHz to 500MHz.
    2)Frequency deviation : ± 35MHz.
    3)Output voltage : 100mV or more.
13. **Dummy Load**
    1)8Ω, 3W or more.
14. **Distortion Meter**
    1)Measurable frequency : 30Hz to 100kHz.
    2)Input level : 50mV to 10Vrms.

* If modulation is not specified for SSG, standard modulation is MOD. 1KHz, DEV. 3KHz, AF : 0.63V/8Ω.

Service jig for adjustment



How to use the jug

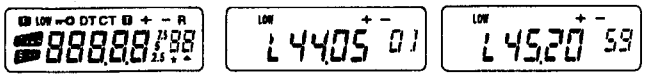


ADJUSTMENT

SERVICE ADJUSTMENT MODE (LINE MODE)

This unit has the built-in "LINE mode" which is used to perform and adjustment and inspection.

[How to set the LINE mode]
Turn on the main power of the unit,while shorting-circuit the TEST land (T) of the control unit board (component side) with GND.
Then the machine enters the LINE mode (initial value: 00 ch. 01 ch through 59 ch can be selected).



(All indications light.) **01ch** **59ch**

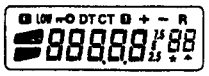
[Operating procedure]
1. You can select any desired channel in the LINE mode by either rotating the encoder or by calling the desired channel directly from the ten keys.
2. If the unit power is turned off while the unit is in the LINE mode,the last channel in the LINE mode is backed up in memory.
3. In the LINE mode,all channels are set to the split channels.

[How to cancel the LINE mode]
Perform the VFO RESET or ALL RESET to exit the LINE mode.

Note : Be sure to perform RESET whenever the service adjustment is completed.

Partial Reset (VFO)
Use to initialize all settings except the memory channels and Memory channel Lockout.
Press **[VFO] + POWER ON.**
- All indicators appear.
- Releasing **[VFO]** does Partial Reset.
- Default frequency is indicated.

All indication



Full Reset (Memory)
Use to initialize all settings.
Press **[F] + POWER ON.**
- All indicators appear.
- Releasing **[F]** does Full Reset.
- Default frequency is indicated.

Destination	VFO Frequency	Frequency Step Size	RX/TX Tone Frequency
K	144 MHz	5 kHz	88.5 Hz
T, E	144 MHz	12.5 kHz	1750 Hz
M, A, 234	144 MHz	12.5 kHz	88.5 Hz

1. Frequency Range

TYPE	Operating Frequency Range (MHz)		Specification Frequency Range (MHz)	
	TX	RX	TX	RX

	CH : 13 : **K** 33 : **M, A, 234** 53 : **T, E** Transmit the moniter set.						The set cannot receive.	
14.DTSS and shock noise check	CH : 14 : **K** 34 : **M, A, 234** 54 : **T, E** TX-RX communicate between the monitor set, and add on a little vibration to the set.	SSG		ANT			(Moniter set) CH : 14 : K 34 : M, A, 234 54 : T, E To be able to TX-RX communicate, and there is no shock noise.	
	CH : 15 : **K** 35 : **M, A, 234** 55 : **T, E** TX-RX communicate between the monitor.						Not to be able to TX-RX communicate	
15.Over voltage level writing	Connect the DC IN to the DCjack, and power on the set. DC power supply : 13.8V						(1)Press the MR key. →"SET" is indicated. (2)Press the F key →"SET b" is indicated. (3)Press the MR key. (4)Press the "#" key again. →"dCErr" is indicated and warning sound rings, (5)Press the "#" key again. →Frequency is indicated.

TH-235A/E/234

SPECIFICATIONS

TH-235A/E

GENERAL

Frequency Range	
U.S.A./Canada	144 to 148MHz
Europe	144 to 146MHz
General market	144 to 148MHz
Mode	F3E(FM)
Usable temperature range	–10°C to +50°C (+14°F to +122°F)
Rated Voltage	
External power supply (DC IN)	7.5 to 16.0V (13.8V)
Buttery terminals	6.8 to 15.0V (7.2V)
Current	
Receive with no signals	Average 50mA
Battery Saver ON	Approx. 14mA
Transmit with H,12.0V	Approx. 1.3A
Transmit with H,7.2V	Approx. 0.8A
Transmit with L,7.2V	Approx. 0.6A
Grounding method	Negative ground
Dimensions(WxHxD projections included)[1]	62.0x166.2x37.2mm 2.44x6.54x1.47in
Weight[2]	Approx. 361g(12.7oz):
Microphone impedance	2kΩ
Antenna impedance	50Ω

TRANSMITTER

Power output	
H,13.8V	Approx. 5W
H,12.0V	Approx. 5W
H,7.2V	Approx. 1.5W
L,7.2V	Approx. 1W
Modulation	Reactance
Maximum frequency deviation	With in ± 5kHz
Spurious emissions	–60dB or less

RECEIVER

Circuitry	Double conversion superhetrodyne
1st intermediate frequency	38.85MHz
2nd intermediate frequency	450kHz
Sensitivity(12dB SINAD)	0.2μV or less
Squelch sensitivity	0.13μV or less
Selectivity(-6dB)	12kHz or higher
Selectivity(-40dB)	28kHz or less
Audio output (10% distortion)	280mW or higher (8Ω load)

[1]With a PB-36 or BT-10 installed.
[2]PB-36 NiCd battery pack, antenna, and belt hook included.
Specifications are subject to change without due to development in technology.
