Table 1 Destination chart

**Overall Frequency configuration**

The 1.2 GHz amateur band has a 40 MHz wide bandwidth. Normally, a frequency band this wide is usually divided into several band segments, for which PLL (Phase locked Loop) VCO's (Voltage Controlled Oscillators) are Micro-processor Selected. However, in the TR-50, in view of its compact size, this amateur band is fully covered by a highly stable PLL system using only a single VCO operating at a 10 kHz step rate. This frequency configuration is shown in Fig. 1.

The received signal is mixed with the first local oscillator signal (lower heterodyne) to become the 139 MHz first IF (intermediate frequency), then further mixed with the 118.065 MHz second local oscillator signal to produce the 20.935 MHz second IF. This 118.065 MHz second local oscillator signal can be varied by  $\pm 5$  kHz or more using the RIT (Receiver Incremental Tuning) control. The 20.935 MHz second IF is mixed with the 20.48 MHz third local oscillator signal (shared in common with the PLL reference oscillator IC) to produce the 455 kHz third IF.

In the transmitter, the reactance-modulated 19.857 MHz signal is amplified and multiplied 7 times to become the 139 MHz FM-modulated RF signal, then mixed with the first local oscillator signal which is used in common with the receiver to produce output within the 1.2 GHz band. The target frequency is amplified up to the required power by a 6-stage microstrip amplifier, then passed through the receiver/transmitter switching relay to be fed to the antenna.

The first local oscillator is PLL synthesized and is common to both the receiver and transmitter. The 20.48 MHz reference oscillator is divided down by 1/4096 to become the 5 kHz comparison signal. The 280.25 MHz to 290.245 MHz VCO oscillator frequency is mixed with the 271.75 MHz local oscillator frequency to yield an 8.5 MHz to 18.495 MHz intermediate PLL frequency, which is further counted down by  $N$  (where  $N$  equals 1700 to 3700) to produce a 5 kHz signal. This 5 kHz signal is compared with the reference 5 kHz signal in the phase comparator, and the comparator output voltage is used to control the VCO oscillator.

The VCO frequency is multiplied by a factor of 4 up to the target frequency and level. At the same time, this circuit controls the level for both transmission and reception.

**Circuit configuration**

The overall configuration is given in page. 32, the block diagram.

The Transceiver can be divided into four basic components, consisting of the Control unit, Relay unit, TX-PLL unit and RX unit. All units are glass epoxy double-sided printed circuit boards, using microstrip techniques, and newly-developed ultra miniaturized parts to increase component mounting density, yielding a compact and high performance radio.

## (1) Control unit

This unit uses an 80-pin flat pack 4-bit CMOS microprocessor Q2 ( $\mu$ PD7514G), which also directly drives the LCD (Liquid Crystal Display). Using its large 4K Bytes of program area effectively, its sophisticated programming permits diversified operating modes and contains all frequency controls.

To make the most of various holding functions, the microprocessor backup mode (data retention function) is used to afford long term data memory. The data for setting the PLL frequency is 16-bit serial output.

Other circuits include Q1 (TC40H004F), which prevents chatter during rotary encoder operation, Q3 (IR2429), which is an A/D converter for displaying the TX RF, RX "S" meter level and BATT levels, and Q4 (TC40H000F), which generates the function "beep" tones.

Table 2  $\mu$ PD7514G-030-12 Terminal function (CONTROL unit Q2)

## (2) Relay unit

This unit is composed of a low-loss 50-ohm coaxial relay for switching between transmission and reception, a printed circuit pattern low pass filter and a low noise microstrip receiver preamplifier Q1

(2SC3358). This pre-amplifier has been especially designed for this wide band application and has superb characteristics, with a noise figure of 3.2 dB within the band and a gain of 8 dB.

## CIRCUIT DESCRIPTION

### (3) RX unit

The received signal from the Relay unit is fed to a 3-pole helical resonator which attenuates the out of band signal component and the target signal alone is amplified by low-noise amplifier Q1 (2SC3358) before being fed to the first mixer Q2 (2SC3356).

The first local oscillator signal (1121 MHz to 1160.99 MHz) produced by the TX-PLL unit is delivered to J4 of the RX unit, passed through the wide band filter circuit, and is then applied to mixer Q2, to produce the 139 MHz first IF signal. This IF signal is passed through the band-pass filter (BPF) consisting of L2 and L3, and is amplified by low-noise GaAs FET Q3 (3SK97). This signal is passed through BPF L4 to L6, and is then applied to gate 1 of the second mixer amplifier Q4 (3SK97).

The second local oscillator circuit is made up of Q10 (2SC2347) and Q11 (2SC2668), and is provided with a voltage follower RIT circuit. This circuit can track a station whose frequency has drifted since the reception frequency will be 118.065 MHz after multiplication by a factor of 9. This second local oscillator signal is input to gate two of Q4 (3SK97), where the signal is mixed with the first IF (139 MHz) to produce the second IF signal (20.937 MHz), then passed through a 2-stage MCF (monolithic crystal filter) (L8). This is amplified by Q5 (2SC2669) before being input to Q7 pin 18 (MC3359P).

The 20.48 MHz reference oscillator frequency from Q17 (MC145155P) on the TX-PLL unit is amplified by Q12 (3SK73GR) as the third local oscillator frequency, then wave-shaped before being fed to Q7 pin 1 (MC3359P) where the incoming IF signal is mixed with the second injection signal (20.937 MHz) to produce the third IF signal (455 kHz). Amplification and other operations (Squelch, Limiting, Quadrature Detection, etc.) for the 455 kHz third IF signal are basically those used in our other current FM transceivers, and employ field-proven circuitry into which minor improvements have been incorporated. The transmitter uses a microphone amplifier circuit with excellent limiter characteristics consisting of Q13 and Q14 (NJM4558S), a crystal oscillator Q15 (2SC2347) (operating at 19.857 MHz), for direct FM modulation and an amplifier and multiplier with a multiplication factor of 7, consisting of Q15 (2SC2347), Q16 and Q17 (2SC2668).

Item	Rating
Nominal center frequency ( $f_0$ )	20,935 MHz
Pass bandwidth	$f_0 \pm 7.5$ kHz or more at 3 dB
Attenuation bandwidth	$f_0 \pm 25$ kHz or less at 40 dB $f_0 \pm 45$ kHz or less at 60 dB
Guaranteed attenuation	70 dB or more within $f_0 \pm 1$ MHz spurious level = 35 dB or more at $f_0 - f_0 + 500$ kHz 80 dB or more at $f_0 \pm (890 \sim 930)$ kHz
Ripple	1.0 dB or less
Loss	2.0 dB or less
Input and output impedance	1.1 kΩ // 0.5 pF

## CIRCUIT DESCRIPTION

### (4) TX-PLL unit

As can be seen in Fig. 1 frequency configuration, the PLL circuit is used in common for both the transmitter and receiver. The VCO uses Q11 (2SK125) in a highly stable Colpitts oscillator circuit operating at output frequency of from 280.25 to 290.245 MHz.

The local oscillator is composed of Q20 (2SC2347), two third-overtone crystals (X2: 54.350 MHz) and Q19 (DTC114Y) switching transistor for switching in 10 kHz steps. This switching operation is controlled by the microprocessor on the Control unit. If the displayed (target) frequency is odd, a local oscillator frequency (multiplied by a factor of 5) of 271.725 MHz is used, whereas if it is even, a frequency of 271.75 MHz is used. This VCO frequency signal is mixed with the local oscillator frequency signal at mixer Q15 (2SC2026) to produce the 8.5 MHz to 18.495 MHz IF signal, which in turn is passed through a low-pass filter, then amplified by Q16 (2SC2347) up to a level sufficient to drive PLL IC Q17 (MC145155P) at the next stage before being input to Q17 pin 9.

The VCO oscillator signal is buffer amplified by Q10 (2SC2026), then multiplies by Q9 (2SC2026) by a factor of 2, and further doubled by Q8 (2SC3355) to produce

the first local oscillator frequency of 1121 MHz to 1160.99 MHz. Q7 (2SC3355) amplifies the signal up to the transmission level. During reception, Q7 is off. Q9 (2SC2026) stops PLL operation to prevent illegal transmission output if the PLL unlocks, and Q14 (2SC2603) turns off. L6 and L7 are a 2-pole helical resonator and serve as a band-pass filter which eliminates unnecessary signals. The transmitter is made up of a 2 DBM (Double Balanced Mixer) circuit consisting of Schottky diodes D5~D8 (ISS99) and their matching transformer. The FM modulated 139 MHz IF signal from the RX unit and the 1121 MHz to 1160.99 MHz first local oscillator frequency signal are input to the DBM circuit and mixed there to produce the final 1260 MHz to 1299.99 MHz output frequency. Unwanted spurious signal components are then eliminated by helical resonator band-pass filter L3. The desired signal is amplified by Q6, Q5, Q4 (2SC3358), Q3 (2SC3357), Q2 (MRF559) and Q1 (2SC2558) up to the final output level before being fed to the Relay unit. All stages of this circuit use microstrip line construction and operate in either Class-A and Class-AB mode. This is a linear, distortion free mode.

## LITHIUM BATTERY (W09-0323-05)

### SPECIFICATIONS

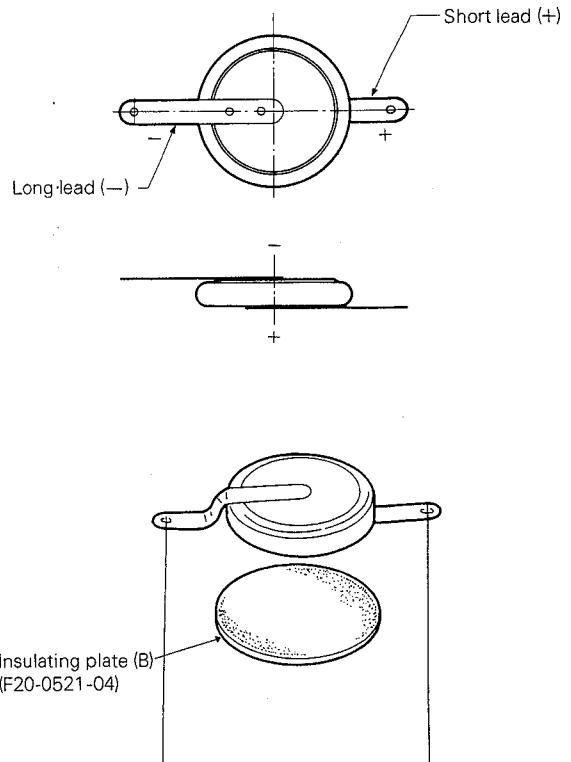

#### Model and Efficiency

Model	CR2032
Nominal Voltage	3V
Nominal Capacity	170 m Ah
Discharge Stop Voltage	2.0 V
Dimensions	Diameter 20.2 mm High 3.2 mm
Weight	3 g

### Replacement procedure

When replace the back-up battery read as follows.

1. Remove the upper and lower cases, then pull out the panel.
2. Take care not to damage parts on the PC board since they are soldered battery.
3. Remount cell again (conform to cell pole).
4. After power switch is on, push the reset switch is on.

# TR-50

## CIRCUIT DESCRIPTION

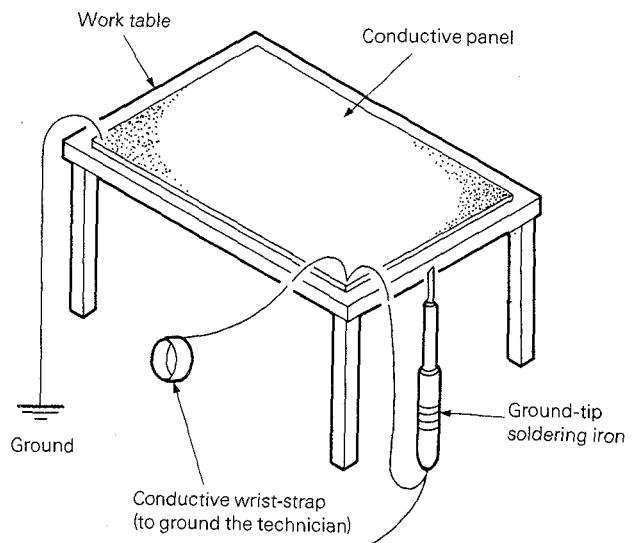

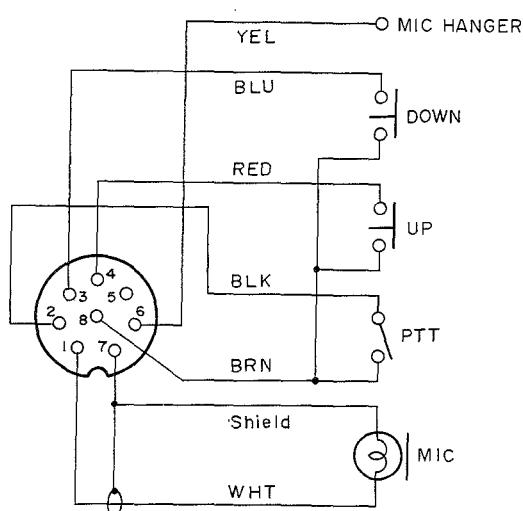

### PRECAUTIONS FOR HANDLING GALLIUM ARSENIDE FET'S

The gallium arsenide FET (3SK97) used in this device is easily damaged by static electricity. Take careful note of the following points when soldering and handling this device.

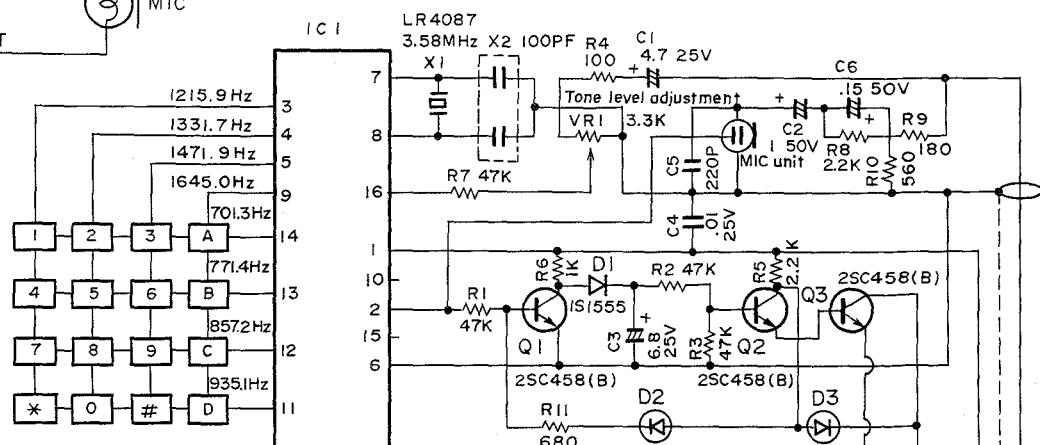

1. When handling this FET separated from the radio, make sure to first discharge yourself to ground.
2. Use a grounded-tip soldering iron.
3. Ground the FET while soldering-in.
4. Cover the work table with a conductive, grounded panel to insure an adequate static discharge path.

## DISASSEMBLY

### Front Panel Disassembly

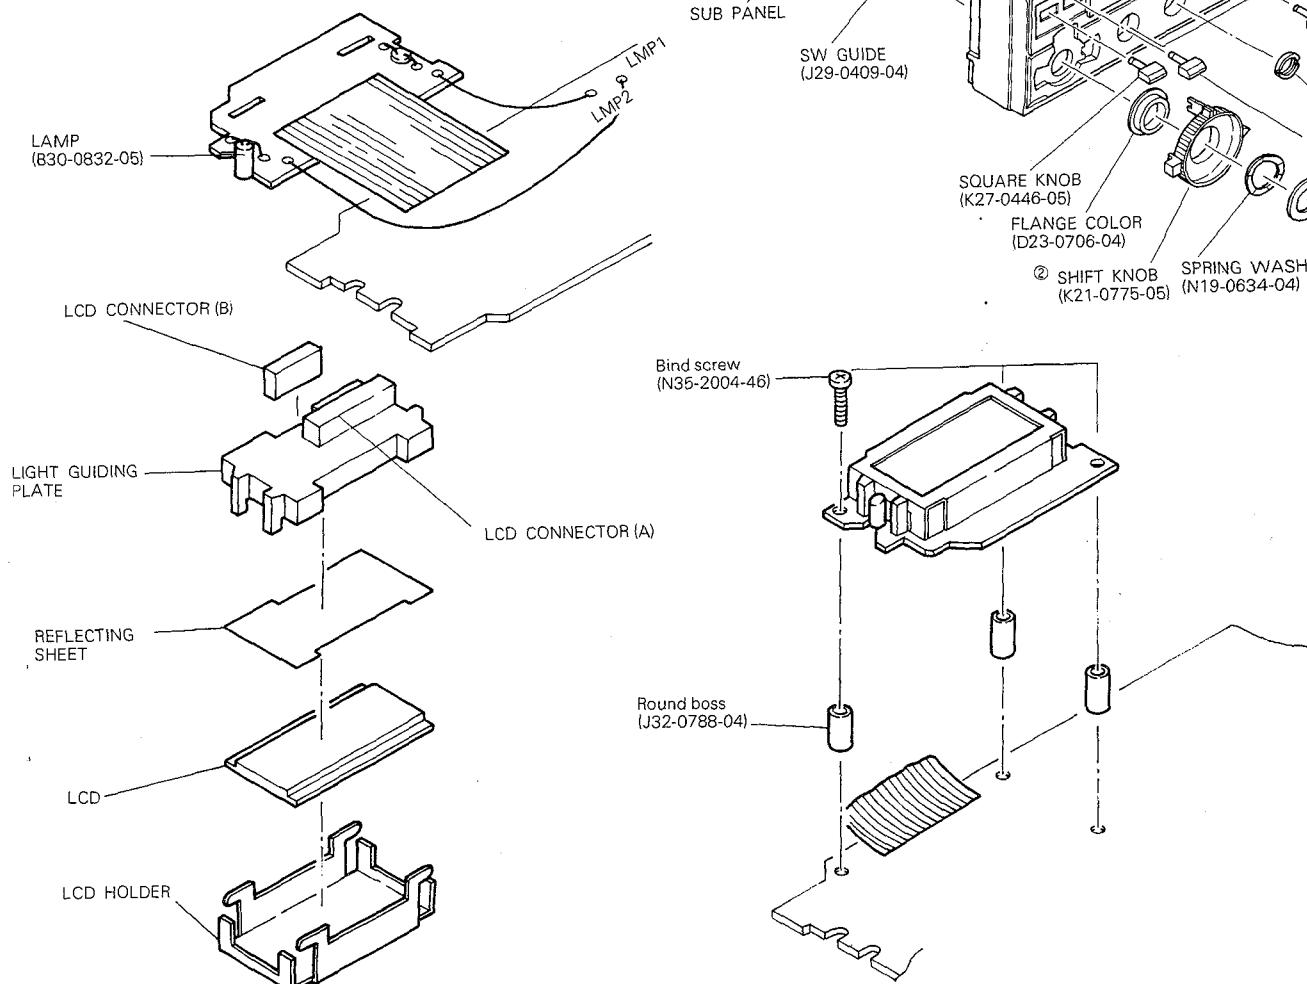

#### NOTES

1. When assembling ①, align the Slider switch knob with the notch on ②.
2. Use the special tool (T-009-01) to assemble/disassemble ③.  
Use the special tool (T-004) to assemble/disassemble ④.

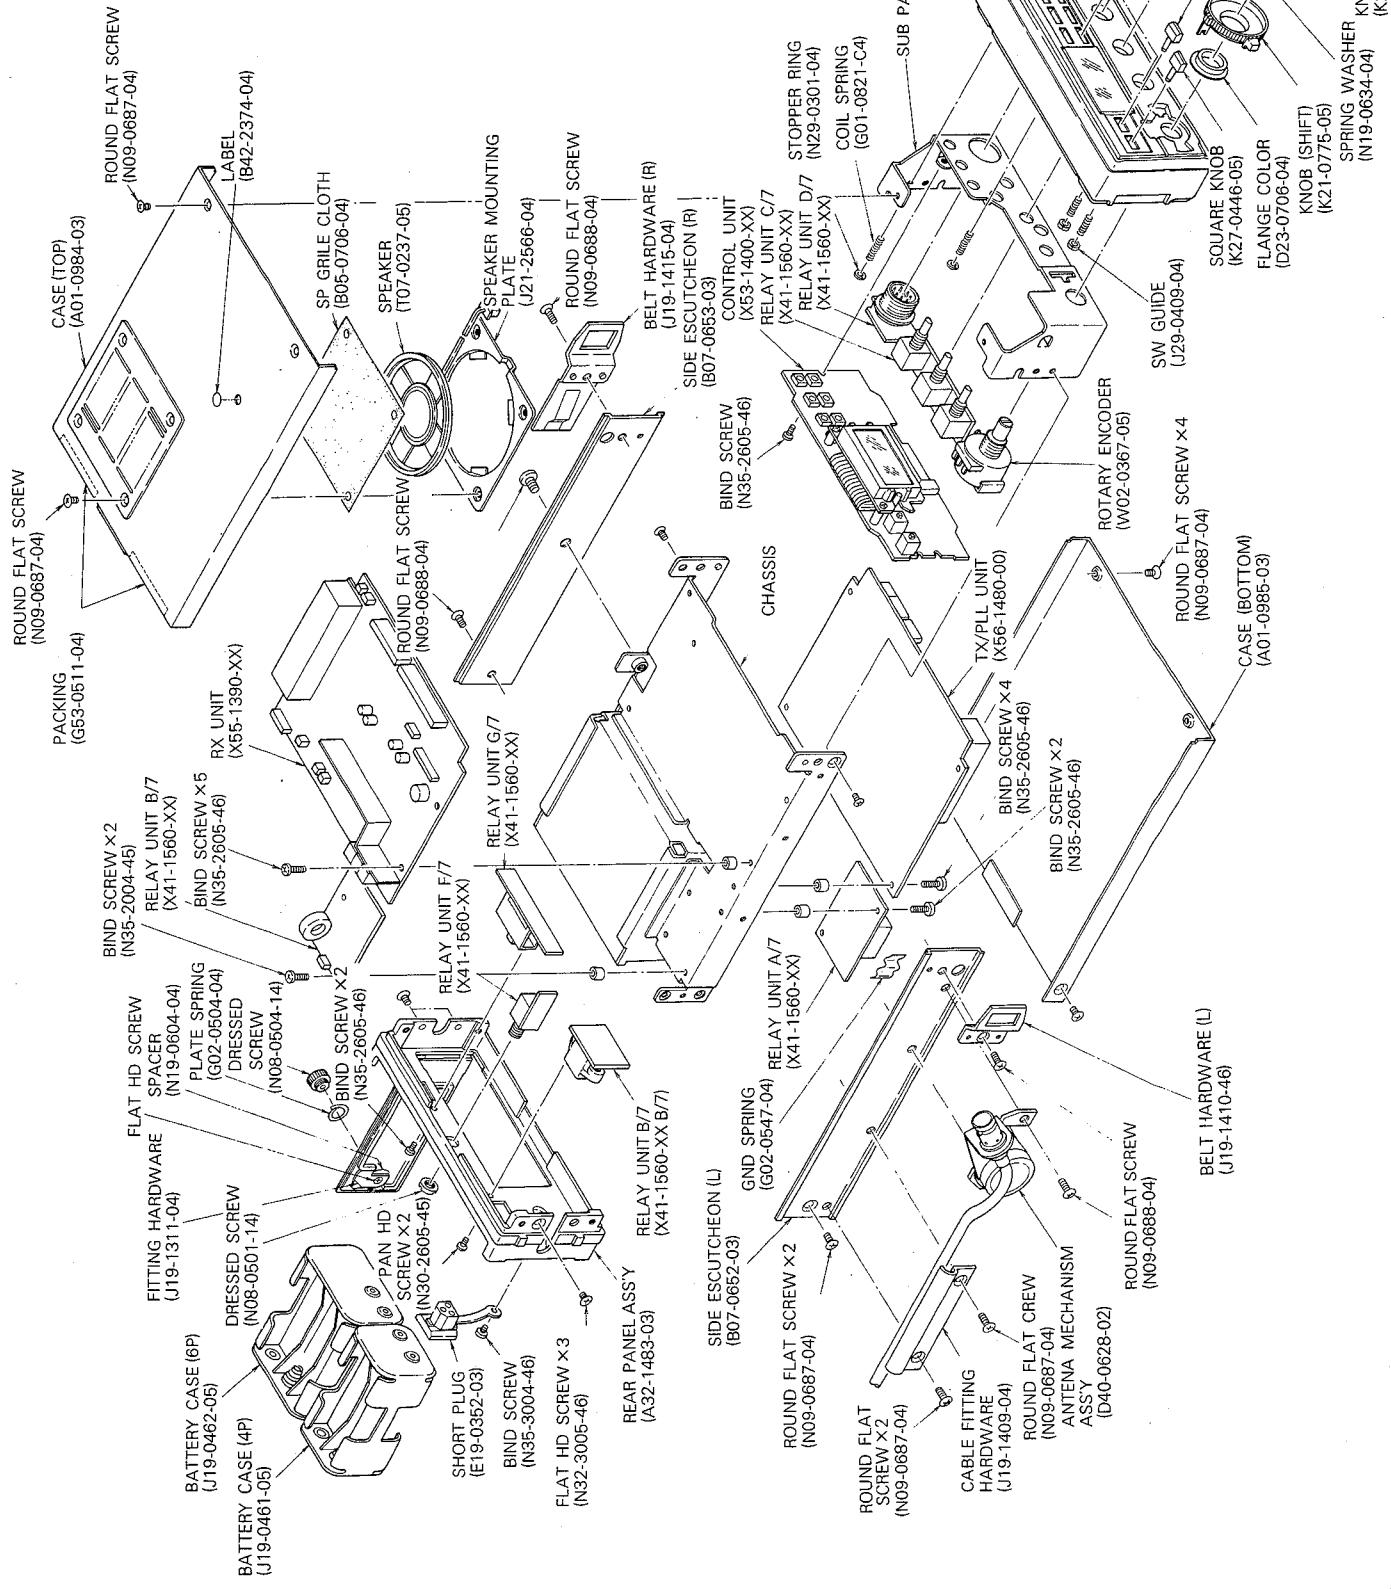

#### SPECIAL TOOL

### DISASSEMBLY FOR LCD

## DISASSEMBLY

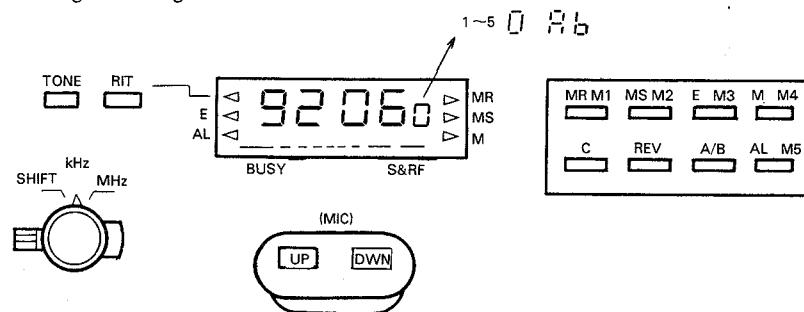

## ADJUSTMENT

### A. Necessary specification of test-equipment

No.	Test-equipment	Specification
1	AVR DC power supply	Current capacity; over 1 [A] Voltage; variable 8~18 [V] (standard; 13.8 [V])
2	Current meter with low loss cable	Full scale 0.3 [A] and 1.0 [A] analog type.
3	f. counter	Upper frequency response; 1.5 [GHz] approx. 0.2 [ppm] stability
4	Power meter with cable (5D2W, 1m)	Upper frequency response; 1.5 [GHz] Impedance; unbalanced 50 Ω Full scale; 3 [W]
5	Dummy resistor	Impedance; 8 [Ω], more than 3 [W]
6	RF VTVM	Upper frequency response; 1.5 [GHz]
7	Linear detector	Upper frequency response; 1~1.5 [GHz] C/N; better than 60 dB
8	DVM	DC input impedance; more than 1 [M Ω] Full scale; approx. 18 [Volt]
9	Oscilloscope	Frequency response; DC~30 [MHz]
10	AF VTVM	Frequency response; 50 Hz~1 [MHz] Minimum range; more than 1 [mV]
11	Spectrum analyzer	Frequency response; DC~4 [GHz]
12	SSG	Upper frequency; more than 1.3 [GHz] Output level; -120 dBm~+20 dBm (0.1 μV) (1 V) Output impedance; 50 [Ω]

### B. Control

Arrangement figure and control function

### C. Preparation

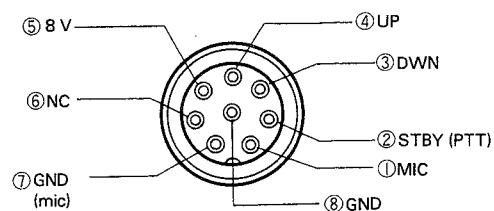

Initial setting for check or adjustment

- Power SW ..... ON
- AF VOL ..... MIN
- SQ VOL ..... MIN
- TONE ..... OFF
- SHIFT SW ..... kHz
- RIT ..... OFF

## ADJUSTMENT

- When adjusting the trimmers or coils, use non-induced adjusting rod.
- When adjusting the RX section, never transmit to prevent SSG damage.
- Connect MIC connector as shown in right Figure.
- Output level of SSG is indicated as SSG's open circuit.

MIC connector (8 pins)

Front panel side view

## ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specification
		Equipment	Unit	Terminal	Unit	Part	Method	
1. TX IF section (139 MHz)	JP-5 (13T) terminates in $50\Omega$ load. Transmits	RF VTVM	RX	JP-5 (13T)	RX	L26, 27 28, 29 30	Max	Better than 0 dBm
						L25	139.000 MHz	$\pm 100$ Hz
2. Sensitivity in Pre.Amp.	Connect SSG (649.75 MHz, 100 dB). RAO terminates in $50\Omega$ load	RF VTVM	Relay	RAO	Relay	TC-1	Center position	
						TC-3	Minimum.	
3. Battery indicator	DC power supply voltage sets to 10.3 [V]. LAMP/BATT SW; BATT					POT.1	Sets max. bar indicate to 8th bar.	
4. PLL part a) Input level to PLL IC	Display f.: 1299.98 [MHz]	Oscillo-scope	TX	TP-1	TX	L22, 23 24, 25	Maximum «caution» L25 adjustment direction; corror move down	Reference 0.3 [Vrms]
						L10	Vary pitch-width	0.35 ~ 1.15 [Vrms]
b) Reference oscillator c) VCO part	Display f.: 1260.00 [MHz]	F. counter	TX	TP-5	TX	TC-8	20, 480 [MHz]	$\pm 100$ [Hz]
						TP-4	L14	$\pm 0.2$ [V]
	Display f.: 1260.00 [MHz]	DVM		TP-3			Confirm 1.2 ~ 1.8 [V]	
	Display f.: 1299.98 [MHz]						Confirm 0.6 [Vrms]	
	Display f.: 1280.00 [MHz]	RF VTVM					Confirm approx. 280.25 [MHz]	
d) Multiply part	HTO terminates in $50\Omega$ load. TX at 1260.00 [MHz]	Spectrum analyzer	TX	HTO	TX	TC-6 output side L6, 7	Max.	$-3 \sim +5$ dBm
						TC-7 input side L6, 7	Max.	$-3 \sim +5$ dBm
	TX at 1299.98 [MHz]	F. counter	TX	HTO			Confirm 1160.98 [MHz]	
							Confirm 1121.00 [MHz]	
	TX at 1260.00 [MHz]							
5. Drive/final stage	Transmits at following f.: 1260 [MHz] 1299.98 [MHz] 1280.00 [MHz]	RF Power meter		TX	Output side L6, 3 TC-5, 4, 3	Max.		
					Input side L6, 3	Max.		
				TX	TC-2, 1	Max.		
				Relay	TC-2	Max.		

## ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specification
		Equipment	Unit	Terminal	Unit	Part	Method	
	1299.98 [MHz]	RF Power meter					Confirm RF output power	Over 1 [W] with less than 0.9 [A] operation 9 current
	1260.00 [MHz]						Confirm RF output power	
6. TX frequency	Pick up TX radio-wave with F. counter. 1260.00 [MHz]	F. counter			TX	VR-2	1260.00 [MHz]	$\pm 300$ [Hz]
	1260.01 [MHz]					L20	1260.01 [MHz]	
7. RF indicator	Transmits at following f.: 1280.00 [MHz]				TX	D1	Coupling capacitance by stripline and D1 lead	Full scale
	Both band edge				TX	D1		
8. Modulation	Connect AG (1 kHz, 2 mV) to MIC jack, and transmite at 1299.98 [MHz].	Linear Detector						
	a) Mic gain						RX VR-6 $\pm 3$ [kHz]	
	b) Dev.						RX VR-3 $\pm 4.5$ [kHz dev.]	
	Increase AG output +20 dB						Confirm $\pm 2.5 \sim 3.5$ [kHz]	
	Decrease AG output to previous level.						Key board (1/2) VR-4 Tone frequency 1750 [Hz]	
c) Tone circuit	Tone ON, (W type)						Key board (1/2) VR-5 $\pm 3.5$ [kHz dev.]	
9. RIT	RIT ON	RF VTVM F. counter	RX	TP-2	RX	L18	Max.	
	RIT knob, center					L17	118.065 [MHz]	
	RIT OFF					VR-2	118.065 [MHz]	
	RIT knob turn						Confirm $\pm 5$ [kHz] variable	
10. Sensitivity	Set f. and output level in following step	SSG oscillo-scope EX Smetter						
	1280 [MHz], 30 dB $\mu$							
	EX Smetter							
	SSG							
	J7-1							
	Oscilloscope							
	AF VTVM							
	Decrease output level to EX Smetter starting point.							
	1280 [MHz], -4 dB $\mu$							
	EX Smetter							
	TC-1,2 L2~7 L10,19 L20,21							
	*TC-2, L20~21 adjust circley.							
11. LCD Bar graph S metter	1280 [MHz], -4 dB $\mu$				RX	L15	AF Max.	More than S/N 20 dB
	1280 [MHz], 0 dB $\mu$					J7-1	TC-1,2 L2~7 L10,19 L20,21	
	In case still LCD bar graph indicates, adjuste L24 in RX unit (adjust mentdirection — corror moves out).					J7-1	Center L1	
	1280 [MHz], 17 dB $\mu$					J7-1	Output side L1	
	1280 [MHz], 6 dB $\mu$					J7-1	Input side L1	
	Output level vary 40 to 100 dB $\mu$					All Bar graph indicates.		

## ADJUSTMENT

## OPERATION CHECKS

Item	Condition	Operation Checks	Specification
1. Operation check	POWER: ON, SQ: ON RESET: ON (TX unit S1)		Display: 60.000 A
	STEP knob; kHz Turn Main knob clockwise: UP counter clockwise: DOWN		in 20 kHz step step up/down
	[A/B] ON		Display: 95.00 b
	Turn Main dial		Step up/down in 10 kHz step
	Connect Mic: Push UP/DOWN button		Change in 1 step each
	Keep pushing UP/DOWN button		Change continuously
	Release UP/DOWN button		Scan start
	Push both button at same time		Scan stop
	Start scan with UP/DOWN button		Scan stop
	Key PTT		
2. Memory	display; 60.00	One beep [M/M4] → display; ► M → [MR/M1] → Memorized	beeps with Morse "R"
	display; 99.98	One beep [M/M4] → display; ► M → [E/M3] → Memorized	beeps with Morse "R"
	display; 80.00	One beep [M/M4] → display; ► M → [MS/M2] → Memorized	beeps with Morse "R"
		One beep [M/M4] → display; ► M → [M/M4] → Memorized	beeps with Morse "R"
		One beep [M/M4] → display; ► M → [AL/M5] → Memorized	beeps with Morse "R", and beeps
	display; 82.00	[AL/M5] → Memorized One beep	beeps with Morse "R"
3. Memory recall	TX	One beep [MR/M1] → Display; ► [MR/(M1)] → Display; 60.00 <sub>1</sub>	
		One beep [MS/M2] → Display; 80.00 <sub>2</sub>	
		One beep [E/M3] → Display; 99.98 <sub>3</sub>	
		One beep [M/M4] → Display; 80.00 <sub>4</sub>	
		One beep [AL/M5] → Display; 80.00 <sub>5</sub>	
		Display; 82.00 <sub>5</sub>	
		[C]	
4. Memory scan		One beep [MS/M2] → Scan CH1 to CH5	
5. Memory erase		One beep One beep One beep [C] → [C] → [E/M3] → Display; E ◀	
		One beep beeps with Morse "R" One beep [M/M4] → [E/M3] → [MS/M2] → Scan CH1 to CH5.	

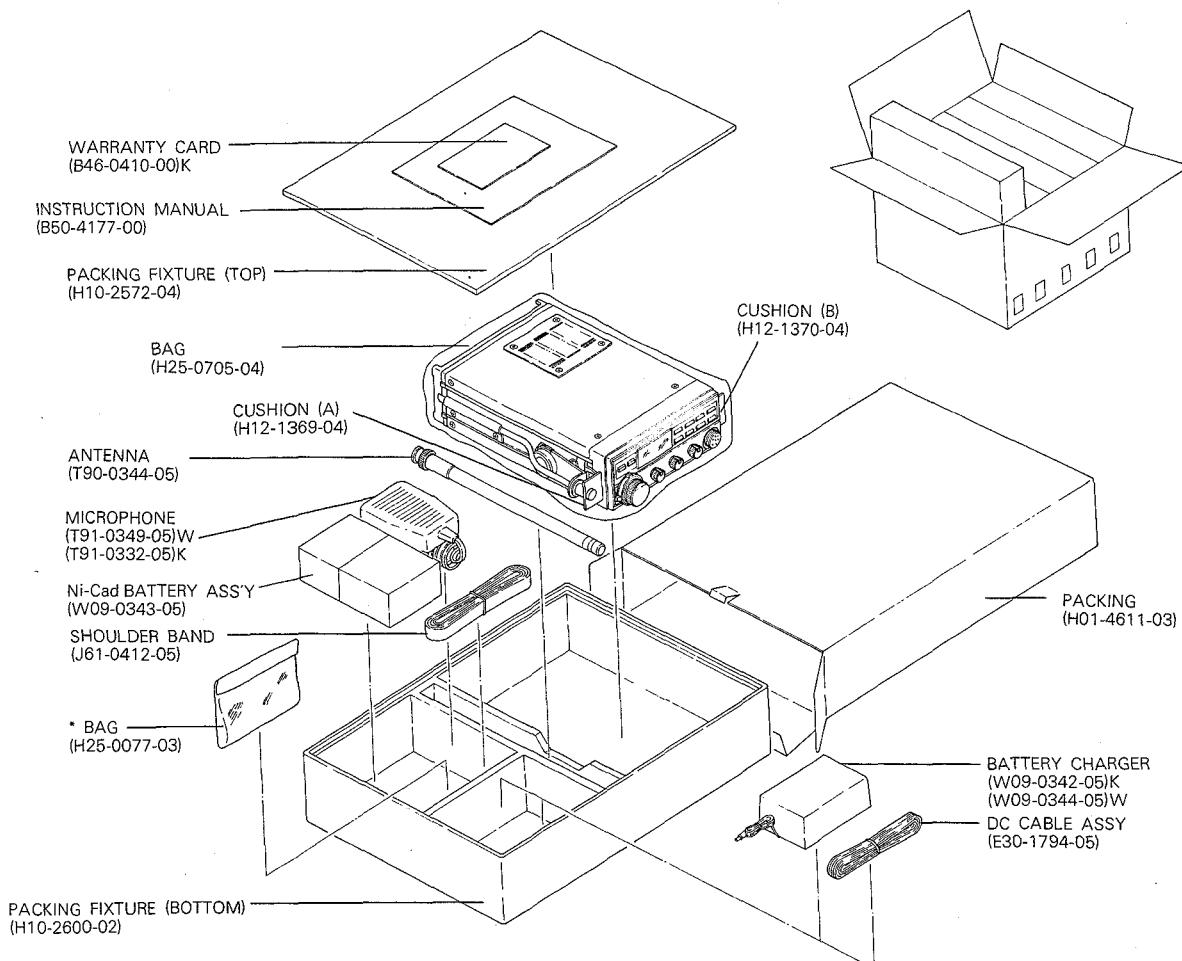

## ADJUSTMENT /PACKING

6. Memory erase	SQ OFF		Busy light. Step next CH, after holding for approx. 5 minutes.
	SQ ON PTT ON		Scan stop
7. Program Scan	Push UP button PTT ON	One beep      One beep      One beep C → MR/M1 → AL/M5 → Display; 80.00	Scan from 80.00 to 82.00. Scan stop
8. Alert	SQ OFF	One beep AL/M5 → Display: AL ← → Beep tone sounds every 7 minute AL/M5 → Alert Operation stops.

## TU-6 SPECIFICATIONS

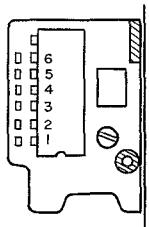

Oscillator frequency .....	1 MHz $\pm 0.1\%$
Usable frequency range.....	37 EIA
Specification Group Frequencies	(67.0—250.3 Hz)
Weight .....	3 g

## TU-6 TONE FREQUENCY CHART

### Setting the frequency

Cut and connect pins 1—6 of the IC to the PC board pattern by soldering to set the frequency.

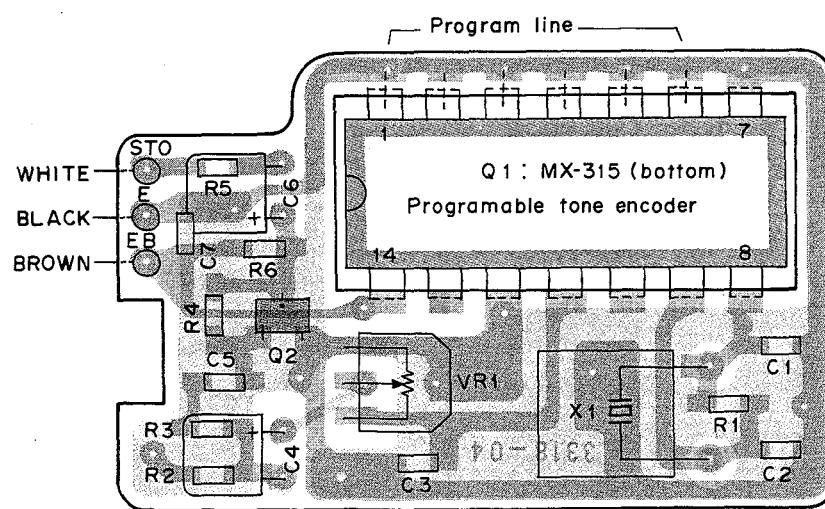

- "0" in the table indicates the connection.
- "1" in the table indicates the disconnection.

# TU-6 (PROGRAMMABLE TONE ENCODER)/PB-16 (Ni-Cad BATTERY) SC-10 (SOFT CARRYING BAG)/MB-3 (MOBIL MOUNT KIT)

## TU-6 SCHEMATIC DIAGRAM

2SC2412K  
2SC2714

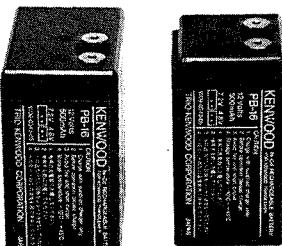

## PB-16 (Ni-Cad BATTERY)

### PB-16 SPECIFICATION

Nominal voltage ... 12 V, 500 mA

Charging voltage ... 15.5 V

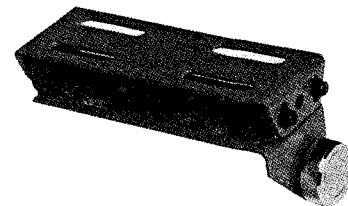

Charging current ... 125 mA

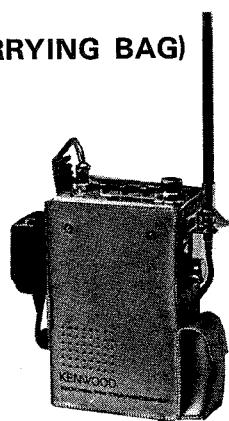

### PARTS LIST

Parts No.	Re-marks	Description
B50-4187-08	N*	Instruction manual
H01-4630-08	N*	Packing carton (inside)
W09-0343-05		PB-16

## MB-3 (MOBIL MOUNT KIT)

## SC-10 (SOFT CARRYING BAG)

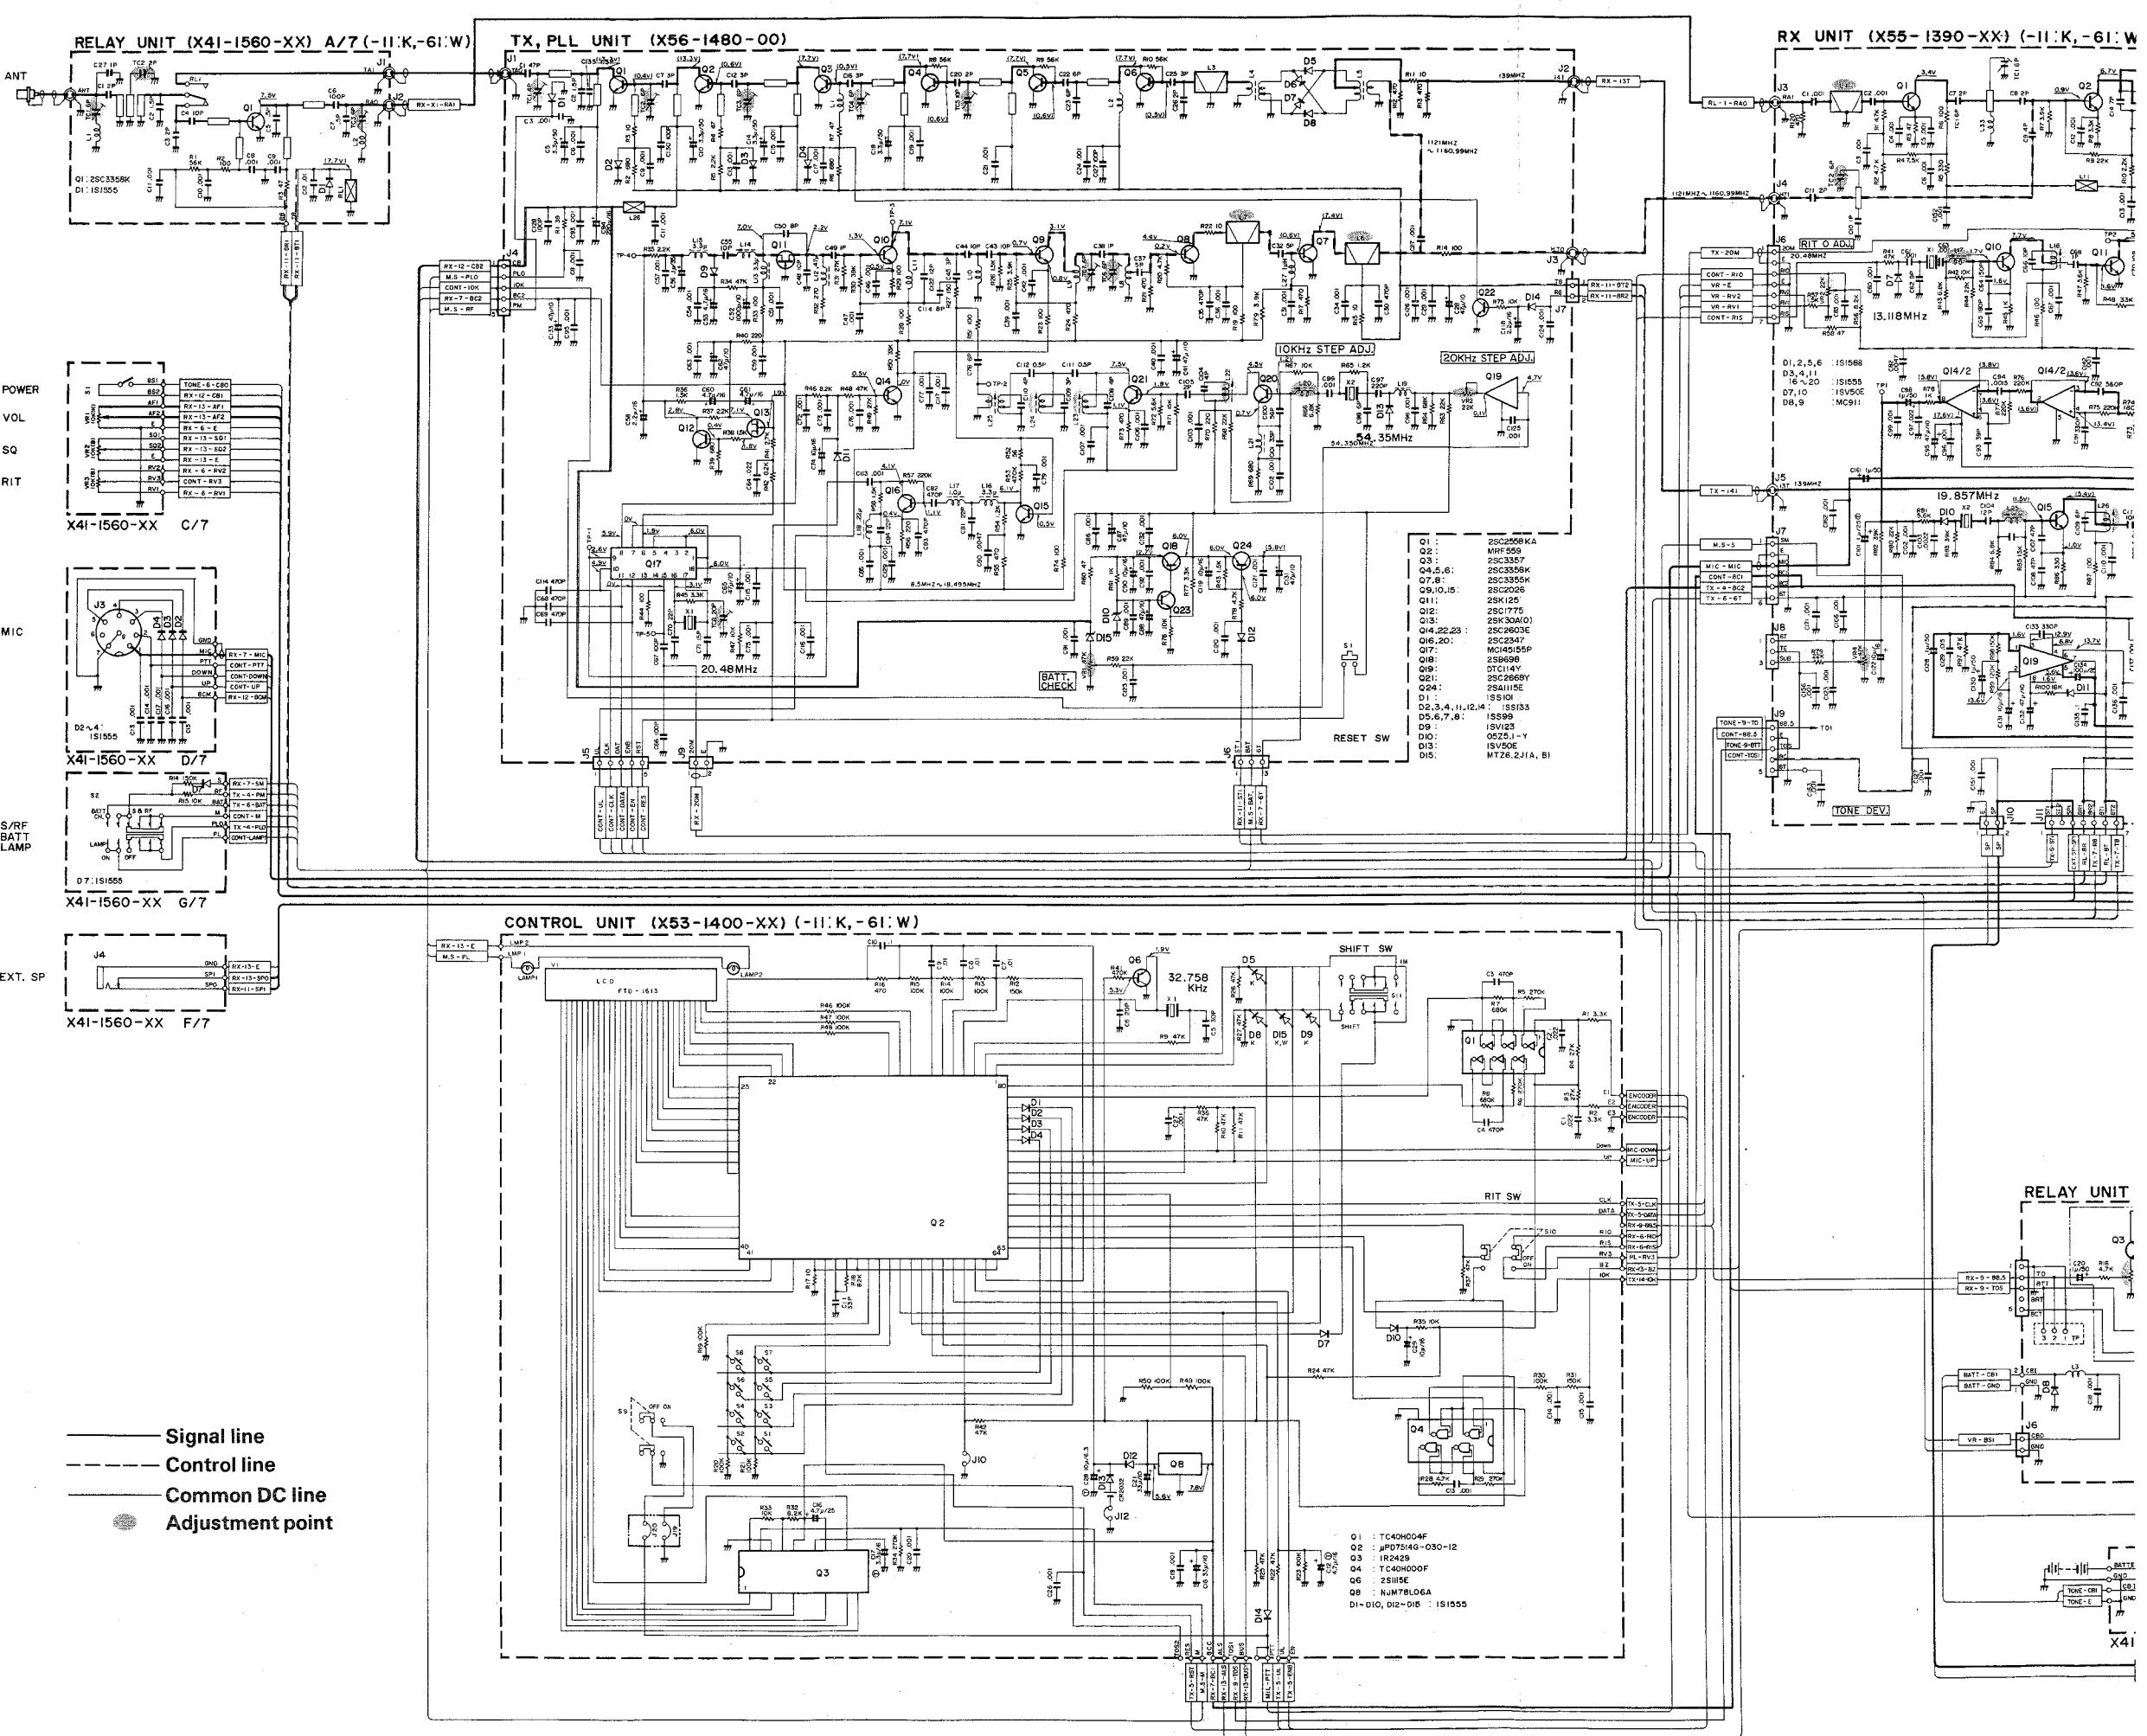

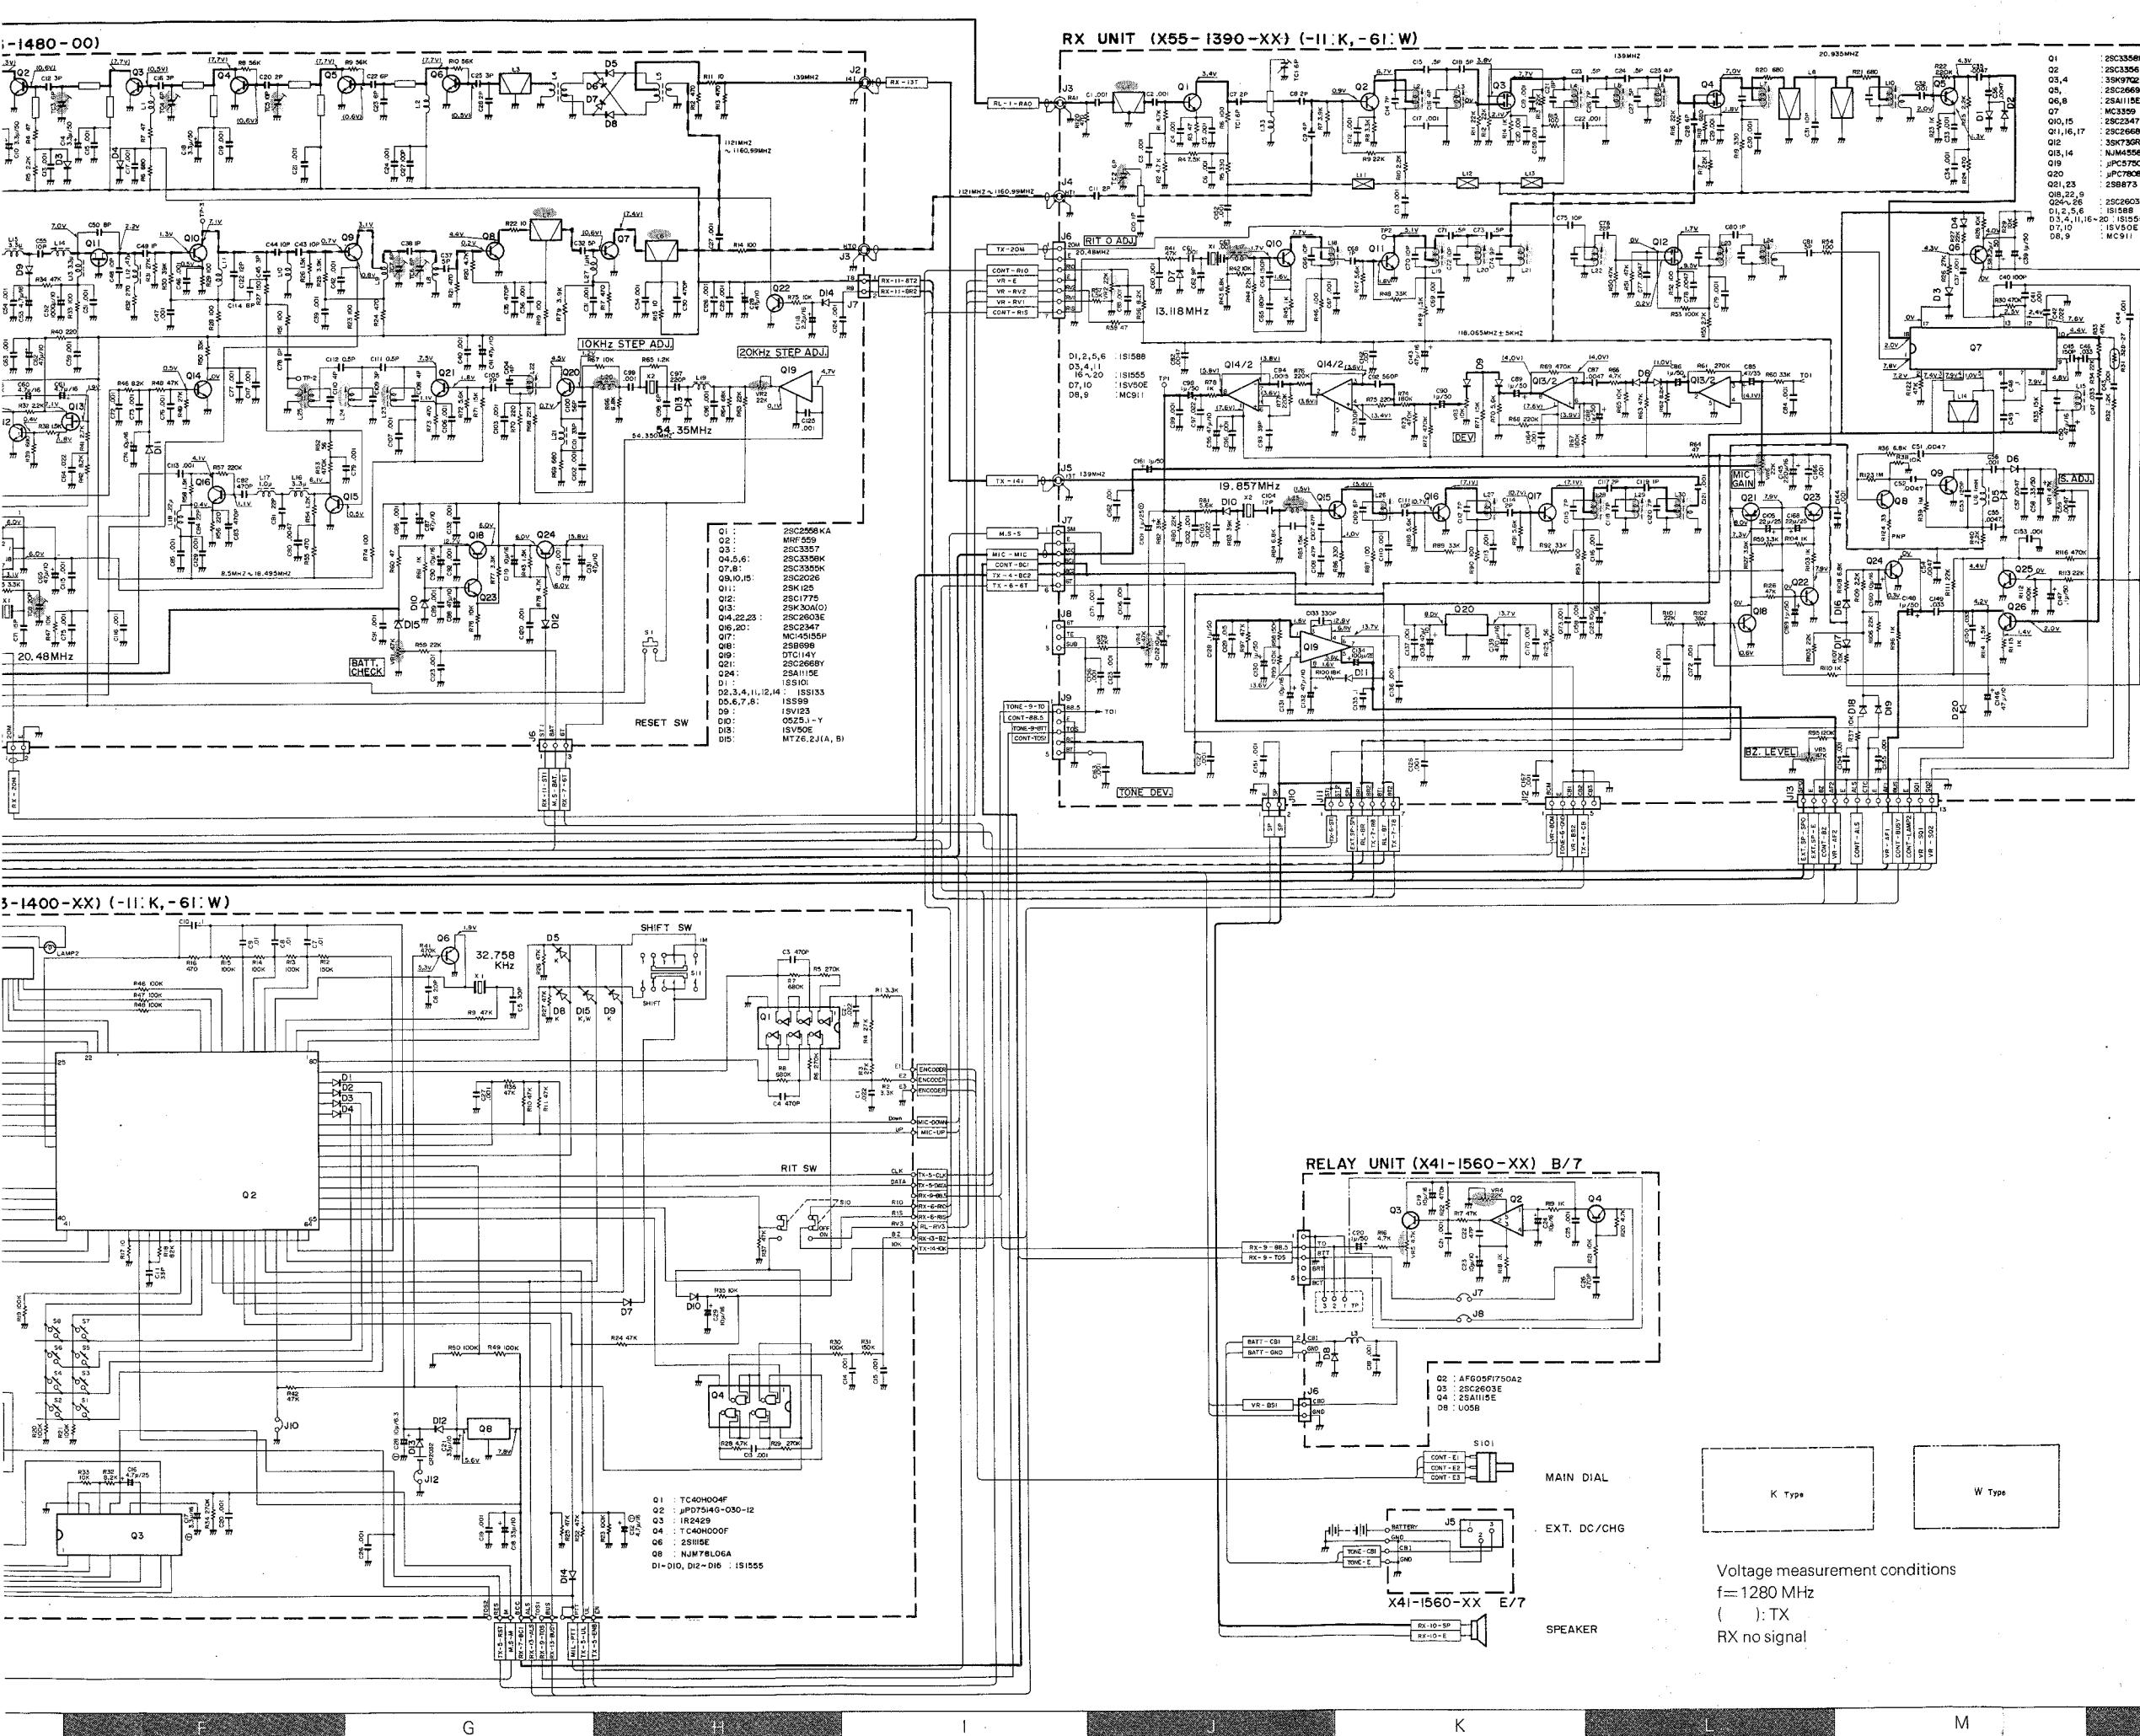

### PARTS LIST

# BLOCK DIAGRAM TR-50 TR-50

## SPECIFICATIONS

### [GENERAL]

Frequency range.....	1260.00—1299.99 MHz
Mode .....	F3
Operating temperature.....	-20°C to +50°C
Antenna impedance .....	50 Ω
Supply voltage.....	13.8 V ±15%, -25%
Current drain (13.8 V, lamp OFF).....	Approx. 180 mA at standby Approx. 850 mA at transmission (1 W)
Dimensions	(Maximum dimensions including projections) ... 123 (157.5) W × 192 (210) D × 51 (51.5) H mm (inch)
Weight.....	Approx. 1,200 g (including antenna and battery)

### [TRANSMITTER]

Output power.....	1 W
Modulation.....	Reactance
Maximum frequency deviation .....	±5 kHz
Spurious radiation .....	-40 dB
Microphone impedance .....	500~600 Ω

### [RECEIVER]

Circuitry.....	Triple superheterodyne
Intermediate frequency.....	1st IF: 139 MHz 2nd IF: 20.935 MHz 3rd IF: 455 kHz
Receiver sensitivity .....	SINAD 12 dB: -10 dBμ (0.3 μV) or less S/N ratio: 30 dB or more at 1 μV input
Squelch sensitivity.....	0.25 μV or more
Pass band width.....	15 kHz or more (-6 dB) 30 kHz or less (-60 dB)
RIT variable range .....	±5 kHz or more
Audio output .....	1 W or more (10% distortion, 8 Ω load)

Note: Circuit and ratings are subject to change without notice due to developments in technology.
