SPECIFICATIONS

(GENERAL)

Transmitter frequency range:

160m BAND 1.8 ~ 2.0MHz
80m BAND 3.5 ~ 4.0MHz
40m BAND 7.0 ~ 7.3MHz
30m BAND 10.1 ~ 10.15MHz
20m BAND 14.0 ~ 14.35MHz
17m BAND 18.068 ~ 18.168MHz
15m BAND 21.0 ~ 21.45MHz
12m BAND 24.89 ~ 24.99MHz
10m BAND 28.0 ~ 29.7MHz

Receive frequency range: 100kHz ~ 30MHz
Mode: A1(CW), A3J(SSB), A3(AM), F1(FSK), F3(FM)
Antenna impedance: 50 Ohm (TX: 20~ 150 Ohm with AT)
Power requirement: 12.0 ~ 16.0V DC
Power consumption:
RX no signal input: Approx. 1.9A
TX: Approx. 20A
Frequency configuration:
RX unit: 1st IF 45.05MHz, 2nd IF 8.83MHz, 3rd IF 455kHz
TX unit: (A1,A3J,A3,FSK) 1st IF 455kHz, 2nd IF 8.83MHz, 3rd IF 45.05MHz
(F3) 1st IF 36.22MHz, 2nd IF 45.05MHz
CW, SSB, AM, FSK, FM: Triple conversion superheterodyne
FM: Double conversion superheterodyne

Semiconductors:

	TS-440S	TS-440S (with AT)
Tr's	157	174
FET's	22	22
IC's	49	58
Diod's	257	277

Dimensions:

	TS-440S	TS-440S (with AT)
W(mm)	270 (279)	270 (279)
H(mm)	96 (108)	96 (108)
D(mm)	313 (335)	313 (335)
Weight(kg)	6.3	7.3

The numbers in the parenthesis include protections.

(TRANSMITTER)

Ratead final power input:

Band \ Mode	A1, A_{3J}, F_1, F_3	A_3
1.8~28 MHz	200 W PEP	110 W PEP

Carrier supression: More than 40dB
Unwanted sidebande supression: More than 50dB
Harmonic content: Less than −40dB
Transmit frequency character: 400~2600Hz (−6dB)
Maximum frequency diviation (FM): ±5kHz
Microphone impedance: 500Ω ~ 50kΩ

SPECIFICATIONS

(RECEIVER)

Sensitivity:

Mode \ Freq.	100 ~ 150kHz	150 ~ 500kHz	0.5 ~ 1.6MHz	1.6 ~ 30MHz
SSB,CW,FSK (S/N10dB)	Less than 2.5μV (8dBμ)	Less than 1μV (0dBμ)	Less than 4μV (12dBμ)	Less than 0.25μV (−12dBμ)
AM (S/N10dB)	Less than 25μV (28dBμ)	Less than 13μV (22dBμ)	Less than 40μV (32dBμ)	Less than 2.5μV (8dBμ)
FM (12dB SINAD)	—	—	—	Less than 0.7μV (−3 dBμ)

Squelch sensitivity: (Threshold)

Mode \ Freq.	100 ~ 150kHz	150 ~ 500kHz	0.5 ~ 1.6MHz	1.6 ~ 30MHz
SSB,CW,AM,FSK	Less than 20μV (26dBμ)	Less than 10μV (20dBμ)	Less than 20μV (26dBμ)	Less than 2μV (6dBμ)
FM	—	—	—	Less than 0.32μV (−10dBμ)

Image ratio: 50dB or more (100kHz ~ 1.6MHz)
70dB or more (1.6 ~ 30MHz)
50dB or more (FM 3rd image ratio)

IF rejection: 50dB or more (100kHz ~ 1.6MHz)
70dB or more (1.6MHz ~ 30MHz)

Selectivity:

Mode \ Freq.	−6dB	−60dB
SB,CW,FSK	More than 2kHz	Less than 4.4kHz
AM	More than 4kHz	Less than 18kHz (−50dB)
FM	More than 12kHz	Less than 25kHz (−50dB)

IF SHIFT variable range: ±0.9kHz or more
RIT/XIT variable range: ±1kHz or more
Audio output power: 1.5W or more (with 8Ω load, 10% distortion)
Audio output impedance 4 ~ 16Ω (Speaker and headphone)

(FREQUENCY STABILITY)

Frequency accuracy: (RIT/XIT OFF) More than $\pm 10 \times 10^{-6}$
Frequency stability: More than $\pm 10 \times 10^{-6}$ (−10°C to 50°C)
(RIT/XIT OFF: at receive)

Reference oscillator frequency: 36MHz

Note: Circuit and ratings subject to change without notice due to developments in technology.

CIRCUIT DESCRIPTION

1. Overview

- The TS-440 is a triple conversion type transceiver, incorporating a general coverage receiver, which uses 45.05 MHz as the first IF, 8.83 MHz as the second IF, and 455 kHz as the third IF.
- The TS-440 is compact, but allows for installation of an optional internal automatic antenna tuner operating in the amateur band from 3.5 MHz to 28 MHz and enables a wide range of antennas to be used.
- The TS-440 also contains a microprocessor-controlled digital PLL circuit which controls frequency in 10 Hz steps using a single crystal oscillator to implement high accuracy and stable frequency control.
- The TS-440 has the following major features:
  (1) Selectable VFOs; VFO-A and VFO-B
  (2) Direct frequency input using a numeric keypad
  (3) 100-channel memory containing frequency band, and mode information (channel 90 to 99 for split frequency memory)
  (4) Memory scan in 10 channel groups and two types of program scan
  (5) RTTY (AFSK) mode available
  (6) Squelch circuit operational in all modes
  (7) Dual filters available to improve selectivity and S/N ratio (optional filter required)
  (8) IF shift, audio notch, IF filter switching, and RF ATT functions for convenient interference reduction
  (9) Large heat sink and cooling fan (100 W) enabling up to one-hour continious transmit operation
  (10) Full and semi break-in circuits for CW
  (11) External-computer controllable (optional interface required)
  (12) Many easy-to-read meter functions such as the received signal strength (s-meter), transmitter power, SWR, and ALC level.

2. Frequency Elements

The TS-440 utilizes a triple conversion transmitter and receiver.

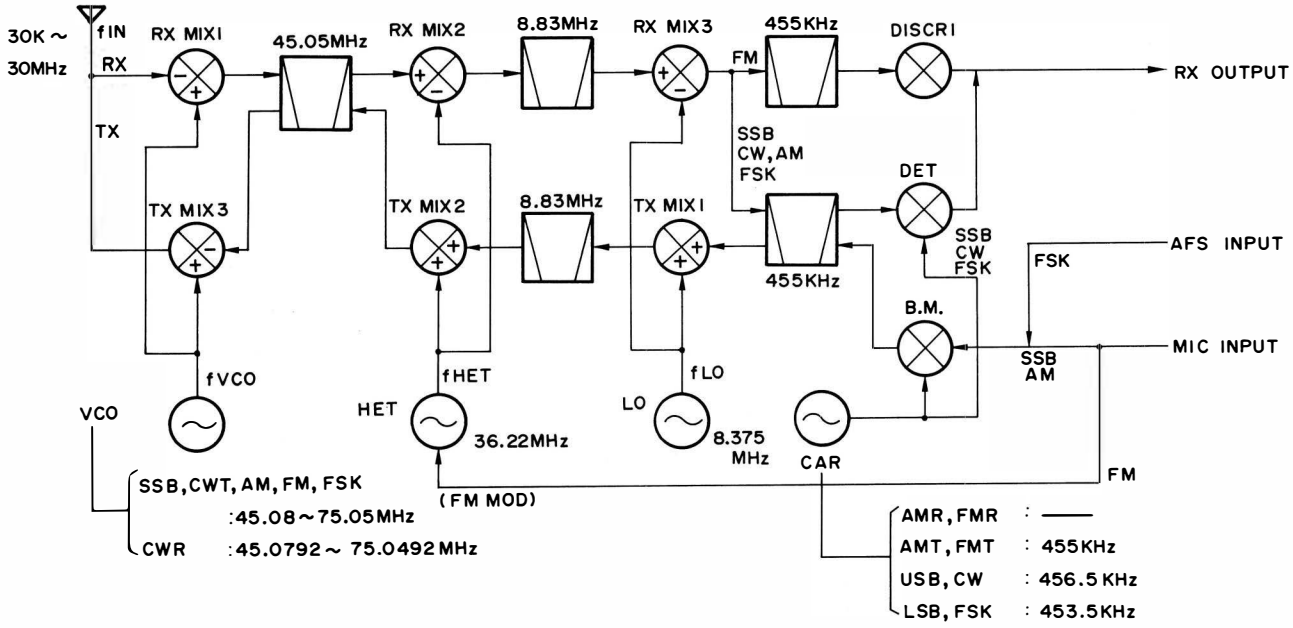

Fig. 1 Frequency configuration

The overall frequency configuration of the TS-440 is shown in Figure 1. The incoming received signal (f_{IN}) is applied to the ANT terminal. This signal is mixed with the local oscillator signal (f_{VCO}) in RX MIX 1 to obtain the first IF frequency. This signal is then mixed with the HET Oscillator signal (f_{HET}) in RX MIX 2, to obtain the 2nd IF frequency. The resulting signal is then mixed with the second local oscillator frequency (f_{LO}) to obtain the 3rd IF frequency. The signal is then combined with the CAR signal for detection. f_{IN} is expressed mathematically as follows:

$$f_{IN} = f_{VCO} - f_{HET} - f_{LO} - f_{CAR} \quad \text{..... 1}$$

CIRCUIT DESCRIPTION

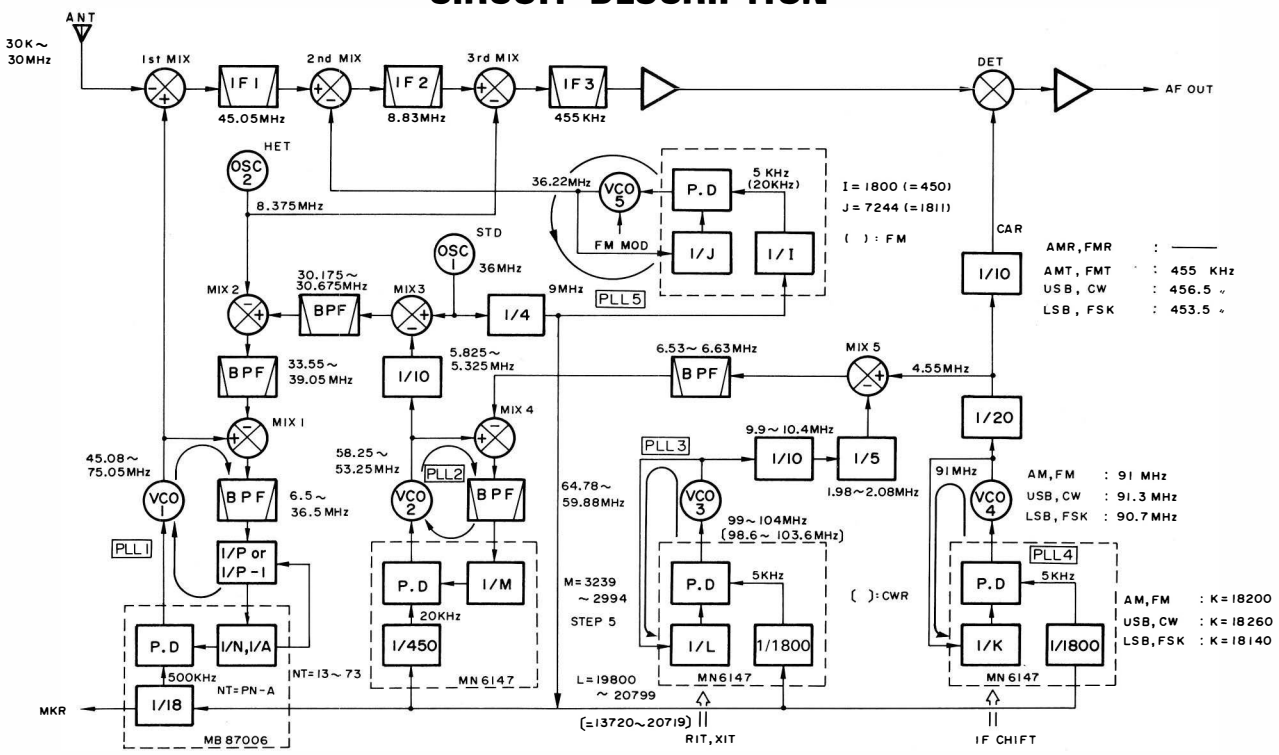

Fig. 2 PLL frequency configuration

As shown in figure 2, all received frequencies excluding the local oscillator frequency f_{LO} are generated in the PLL circuit. The frequencies generated in these loops are expressed as follows:

VCO5: $$\frac{f_{VCO5}}{J} = \frac{\frac{1}{4}\cdot f_{STD}}{I} \quad \therefore f_{VCO5} = \frac{J}{4I} f_{STD} \quad \cdots\cdots 2$$

VCO4: $$\frac{f_{VCO4}}{K} = \frac{\frac{1}{4}\cdot f_{STD}}{1800} \quad \therefore f_{VCO4} = \frac{K}{7200} f_{STD} \quad \cdots 3$$

VCO3: $$\frac{f_{VCO3}}{L} = \frac{\frac{1}{4}\cdot f_{STD}}{1800} \quad \therefore f_{VCO3} = \frac{L}{7200} f_{STD} \quad \cdots\cdot 4$$

VCO2: $$\frac{f_{VCO2} + \frac{f_{VCO3}}{50} + \frac{f_{VCO4}}{20}}{M} = \frac{\frac{1}{4}\cdot f_{STD}}{450}$$

$$\therefore f_{VCO2} = \frac{M}{1800}\cdot f_{STD} - \frac{f_{VCO3}}{50} - \frac{f_{VCO4}}{20} \quad \cdots 5$$

VCO1: $$\frac{f_{VCO1} - f_{LO} - f_{STD} + \frac{f_{VCO2}}{10}}{N} = \frac{\frac{1}{4}\cdot f_{STD}}{18}$$

$$\therefore f_{VCO1} = \frac{N}{72} f_{STD} + f_{LO} + f_{STD} - \frac{f_{VCO2}}{10} \quad \cdots 6$$

Based on these formulas, the frequencies f_{VCO}, f_{HET}, and f_{CAR} are expressed as follows:

$$f_{VCO} = f_{VCO1} = \left(\frac{N}{72} - \frac{M}{1800} + \frac{L}{3600000} + \frac{K}{1440000} + 1\right)\cdot f_{STD} + f_{LO} \quad \cdots\cdots 7$$

$$f_{HET} = f_{VCO5} = \frac{J}{4I}\cdot f_{STD} \quad \cdots\cdots 8$$

$$f_{CAR} = \frac{f_{VCO4}}{200} = \frac{K}{1440000} f_{STD} \quad \cdots\cdots 9$$

Formula 1 may now be rewritten as follows:

$$f_{IN} = \left(\frac{N}{72} - \frac{M}{180000} + \frac{L}{3600000} - \frac{J}{4I} + 1\right)\cdot f_{STD} \quad \cdots\cdots 10$$

Note that f_{LO} is not included in formula 10 . That is, a received frequency is determined by the reference frequency f_{STD} and frequency division data I to N. Further analysis of formula 10 shows the following:

i) Basically, frequency division data I to N contain no error because they are controlled by the microprocessor according to the operating frequency.
ii) The accuracy of the operating frequency is equal to that of the reference frequency, because all frequencies other than f_{STD} in formula 10 are determined by the microprocessor.
iii) The operating frequency does not change even if k or f_{LO} changes.

When f_{IN} = 14 MHz (USB mode) in formula 10 , f_{IN} and f_{STD} have the following relationship:

CIRCUIT DESCRIPTION

I = 1800, J = 7244, K = 19800, L = 3239, M = 41

$\therefore f_{IN} = 0.388\ f_{STD}$ 11

When f_{IN} = 30 MHz (USB mode) in formula 10 , f_{IN} and f_{STD} have the following relationship:

I = 1800, J = 7244, K = 19800, L = 3239, M = 73

$\therefore f_{IN} = 0.833\ f_{STD}$ 12

Since the precision of the reference crystal oscillator used in the TS-440 is 10 ppm (−10 to 50°C) and the receiver system has the characteristics shown in items i) and ii), the total accuracy is stable at any point from 30 kHz to 30 MHz. The maximum amount of frequency shift is only +/−300 Hz (see formula 12). The characteristic shown in item iii) enables variable band functions such as IF shift to be implemented, using the microprocessor. The microprocessor also is used to set carrier points by adjusting f_{CAR}, and to set and adjust the amount of IF shift.

So far received frequencies in the SSB mode have been discussed. For receive modes other than SSB, and in transmit mode, operating frequency is determined by the reference frequency and frequency division data.

In CW receive mode, f_{VCO} is shifted down 800 Hz and used as f_{VCO3}. In AM or FM receive mode, f_{CAR} generation is stopped. In FM receive mode, f_{HET} is modulated by adding audio signals to VCO5 from the microphone. FSK (RTTY) is transmitted in LSB mode and uses AFSK by adding audio signals externally.

The type of frequency displayed differs, depending on the mode, as shown in Table 1.

Mode	Displayed frequency
USB, LSB, FSK	Carrier point frequency
CW	Transmission carrier frequency
AM, FM	IF filter center frequency

Table 1 Displayed frequencies

3. Receiver Circuit Description

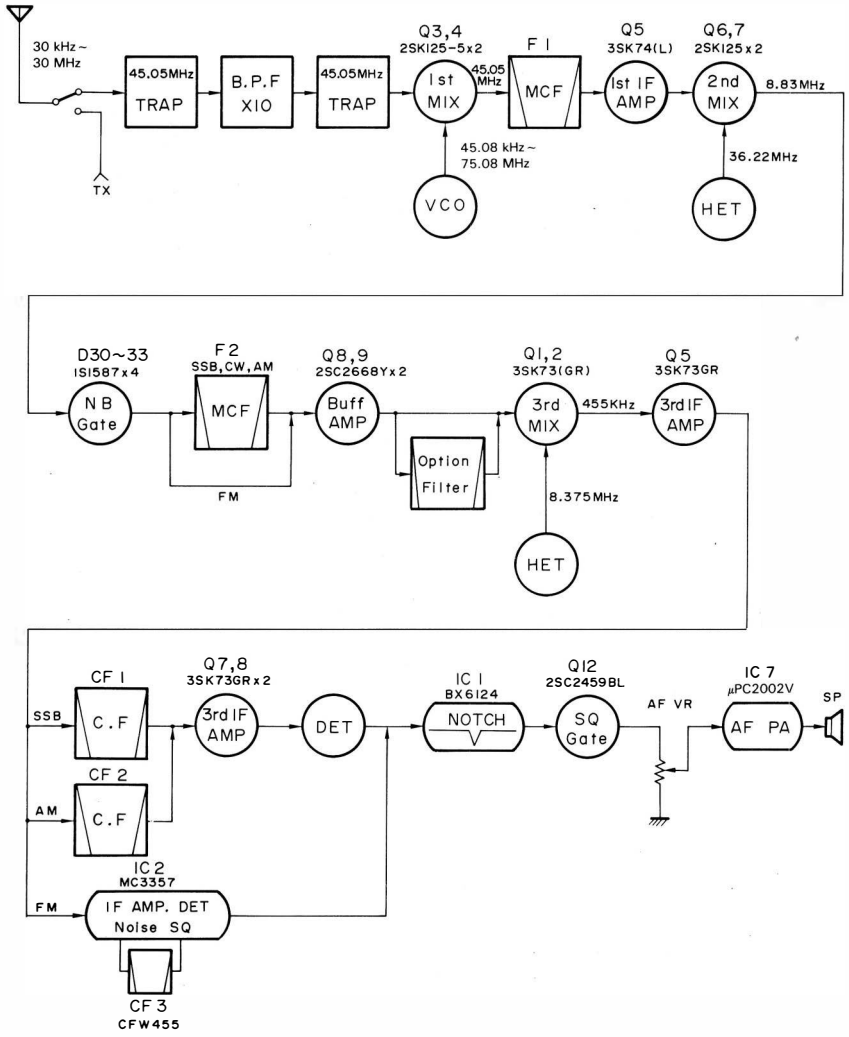

Fig. 3 Receiver circuit configuration

CIRCUIT DESCRIPTION

Signals from the ANT pin are fed into the RAT pin of the RF unit via the transmit/receive switching relay. The signals then go to the 10 BPFs through the approx. 20 dB attenuator circuit, the first stage of the first IF trap circuit, and the low pass filters (which pass only 500 kHz or less). The signal then goes through the second stage of the first IF trap circuit, and is mixed with the VCO signal and converted into the first IF signal of 45.05 MHz in the first mixer, consisting of Q3 and Q4 (2SK125-5). The VCO circuit consists of Q21 to Q24 (2SC2668Y) and oscillates in four bands from 45.05 MHz to 75.05 MHz. Oscillator frequencies are controlled by DC signals from the PLL unit.

The first IF signal of 45.05 MHz is passed through the MCF (F1), which is used in both receive and transmit, and is amplified by the first IF amplifier Q5 (3SK74L). In the second mixer, consisting of Q6 and Q7 (2SK125), the first IF signal is mixed with the heterodyne oscillator signal (36.22 MHz) from the PLL circuit, amplified by Q12 (2SC2668Y) to obtain the second IF signal (8.83 MHz). The second IF signal of 8.83 MHz goes through the gate of the noise blanker. In modes other than FM , the signal then goes through the MCF (F2) and is fed into the IF unit through buffer amplifiers Q8 and Q9 (2SC2668Y).

When the optional 8.83 MHz filter is connected, the second IF signal is then fed from the IF unit into the optional filter. In the third mixer, consisting of Q1 and Q2 (3SK73GR), the second IF signal is mixed with 8.375 MHz signal generated by IF unit's heterodyne oscillator circuit, consisting of Q53 and Q54 (2SC2458Y), and converted into the third IF signal (455 kHz). The third IF signal is then amplified by Q5 (3SK73GR). A diode switch is used to route the signal to either the FM or SSB circuits.

In SSB mode, the third IF signal goes through the SSB ceramic filter (XF3). In AM mode, the third IF signal goes through the AM ceramic filter (XF4). In either mode, the third IF signal is then amplified by Q7 and Q8 (3SK73GR) and detected. In FM mode, the third IF signal goes through the FM ceramic filter (XF5). The signal is then sent to the FM IF, IC2 (MC 3357) for amplification and detection. IC2 also contains an FM noise squelch circuit.

The detected SSB/AM signal is passed through the notch circuit, consisting of hybrid IC IC1 (BX6124) and squelch gate Q12 (2SC2459BL). The signal then goes through the AF volume control and is amplified to the appropriate level by AF amplifier IC7 (UPC2002V).

1) Selectivity circuit

Figure 4 is a selectivity circuit diagram. In auto mode, the appropriate bandwidth filter is automatically selected according to mode. When an optional filter is used, two filters are available. Tables 2 and 3 shows the various combinations of bandwidth available when optional filters are used. In FM mode, the selectivity switch does not operate and a single dedicated FM filter is used. Optional filters operate only in receive and are separate from the filters used in transmit.

CIRCUIT DESCRIPTION

2) AF notch circuit

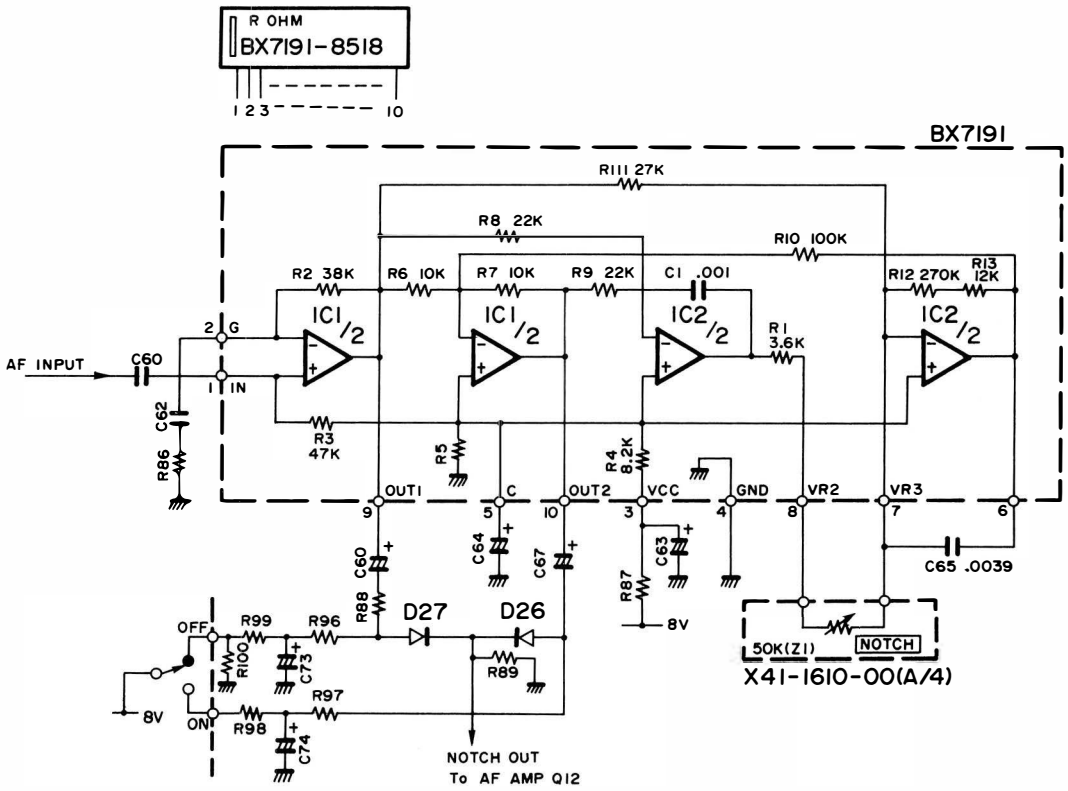

Fig. 5 NOTCH circuit

The hybrid IC1 in the IF unit is an audio notch circuit. Figure 5 shows its equivalent circuit. This circuit forms state-variable bandpass filter, also known as a bi-quad filter. The notch frequency can be changed using the notch control variable resistor. Since the circuit consists of the hybrid IC, stable attenuation characteristics can be obtained electrically and thermally. The range of variable notch frequencies is 400 Hz to 2600 Hz.

The notch frequency is determined by the following two formulas.

1) $f_N \fallingdotseq \sqrt{R6/2\pi}\sqrt{(R1 + \text{Notch VR}) \cdot R8 \cdot R10 \cdot C1 \cdot C65}$ 1
2) $R6 \cdot (R12 + R13) \fallingdotseq R10 \cdot R11$ 2

If a variable resistor is used for resistor NOTCH VR, the notch frequency can be controlled according to formula 1). The notch frequency range is from 400 to 2600 Hz, and attenuation is from 25 to 50 dB.

CIRCUIT DESCRIPTION

3. Transmitter Circuit Description

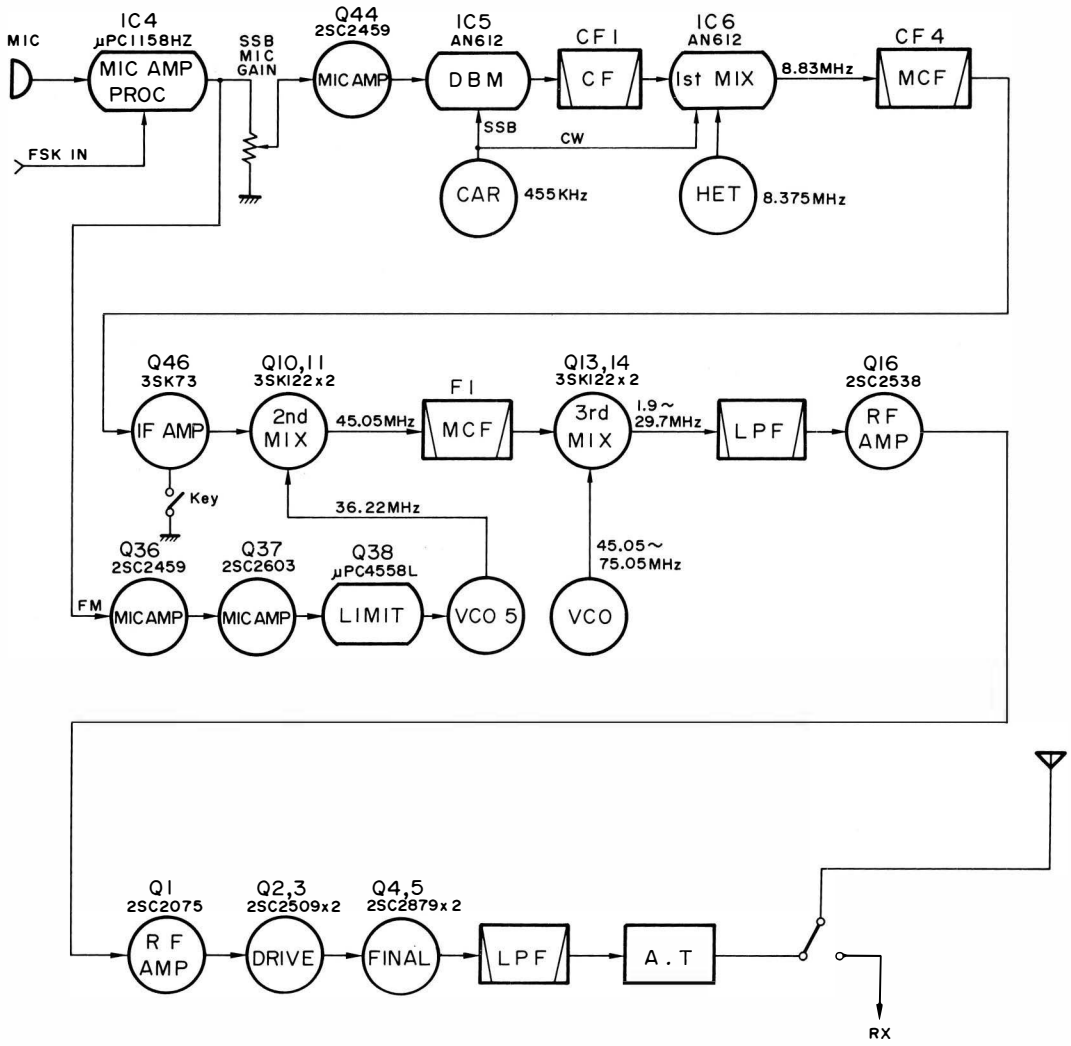

Fig. 6 Transmitter circuit configuration

In SSB, CW, AM, or FSK mode, the transmitter system uses triple conversion. In FM mode, the transmitter system uses double conversion using PLL modulation.

Audio signals from the microphone are applied to the MIC pin (connector (21)) of the IF unit and are separated into SSB modulation and VOX signals. The SSB signal is amplified approx. 8 dB by IC4 (µPC1158HZ). AFSK audio signals from the AFSK IN pin (back panel) are also applied to IC4.

IC4 functions as a SPEECH processor. Output from IC4 is distributed to the MIC GAIN control (front panel) and FM circuit (RF unit). In SSB mode, the signal applied to the MIC GAIN control is sent back to the IF unit (connector (23) MV2), amplified by Q44 (2SC2459), and supplied to the balanced modulator IC5 (AN612). In FM or CW mode, Q44 does not operate because a cut-off voltage is supplied to its emitter via diodes D82 and D46. The signal converted to 455 kHz

CIRCUIT DESCRIPTION

DSB by IC4 goes through the SSB transmit switching diodes D17 and D18, filter switching diodes D14 and D12, and SSB ceramic filter CF1, to obtain the SSB signal. The SSB signal then goes through the transmit switching diode D36 and is fed into the transmit first mixer, IC6, where the SSB signal is mixed with the output from the 8.375 MHz oscillator in the IF unit, and converted to 8.83 MHz. In CW or FM mode, the carrier signal from the PLL unit does not go through IC5 BM or the 455 kHz filter. These carrier signals are applied to IC6 via switching diodes D53 and D54. The output signal from IC6 goes through the MCF to remove spurious components, and is amplified by the IF amplifier Q46 (3SK73) and sent to the RF unit. Q46 provides ALC control and CW keying.

In the transmitter second mixer, consisting of Q11 and Q12, (3SK122), the 8.83 MHz transmit IF signal input to the RF unit is mixed with HET oscillator signal (36.22 MHz) from the PLL unit and converted to 45.05 MHz signals. The 45.05 MHz signal goes through D23 and the MCF to remove any spurious components. The 45.05 MHz signal then goes through D27 and is supplied to the transmit third mixer consisting of Q13 and Q14 (3SK122). In the third mixer the signal is mixed with VCO signal (Q21 to Q24) amplified by Q12 (2SC2668) and converted to the required transmit frequency (1.8 to 29.7 MHz). The signal from the third mixer goes through the low pass filters C156, C158, C159, and L89, and is amplified by the wide band amplifier Q15 (2SC2570). The signal then goes through the wide band transformer T19 and low pass filters C164, C165, and L90, and is further amplified by wide band amplifier Q16 (2SC2538). The signal from the Q16 goes through the output transformer T20 and is used as the drive output.

In FM mode, the PLL VCO is directly modulated. The audio signal from IF unit IC4 (UPC1158HZ) is fed into the RF unit via the FMI pin. In the RF unit, the audio signal is amplified by Q36 (2SC2459) and Q37 (2SC2603), and goes through the limiter circuit consisting of Q38 (UPC4558C) and low pass filter circuit, and is sent to the PLL unit via the FMD pin. In the PLL unit, the 36.22 MHz VCO is modulated. Q39 (2SC2603) is a switching circuit to prevent the modulated signals from being emitted from the PLL unit in a mode other than FM.

For ''S'' model radios the output from the RF unit is amplified to a 100 W power level by Q1 (2SC2075), Q2 and Q3 (2SC2509), and Q4 and Q5 (2SC2879) in the final unit. The 100 W output goes through the LPFs which differ by bands, and is sent as output to the antenna via the AT unit and transmit/receive switching relay. SWR and ALC detection is performed at the output of the LPFs.

1) Antenna tuner

The antenna tuner operates when the AUTO/THRU switch is in the AUTO position and the AT TUNE switch is ON. The antenna tuner is driven in the CW mode and power is reduced to 50 W by the microcomputer regardless of the mode selected before the AT TUNE switch was turned ON. The range of operating frequencies is determined by a microcomputer program, and is from 3.5 MHz to 30 MHz.

- **AT unit operation**

  Power transmitted by the final unit passes through the current and voltage detecting transformers L1 and L2 using toroidal cores. Current and voltage components detected by the transformers are supplied to pins 9 and 13 of IC2 for wave shaping and their phases are compared by IC3 HD10131. The output from pin 3 of IC3 depends upon the phase of the voltage and current waveforms applied to IC3. The signal from IC3 pin 3 is sent to pins 10 and 15 of buffer IC IC3 HD10125. Output from pins 12 and 13 of IC3 goes through level shift Zener diodes D5 and D6 to control the input circuit of motor drive IC IC5 BA6109U2. The output signal is used to drive motor M1 to adjust the variable capacitor VC1 so that the phase difference between voltage and current components is reduced.

  The current and voltage components output from the current and voltage detecting transformers is also supplied to the voltage comparator IC1 NJM2903D. The comparator output is used by motor drive IC IC6 BA6109U2 to drive motor M2 to adjust variable capacitor VC2 so that the amplitude difference is reduced. That is, the phase control variable capacitor VC1 is controlled so that the current is in phase with the voltage and the voltage control variable capacitor VC2 is controlled so that the amount of amplitude difference between the current and voltage is reduced (SWR1, an SWR of 1 to 1, is obtained when the current and voltage are in phase and the amount of amplitude difference is 0). VC1 and VC2 are designed to operate independently of each other, but since phase difference affects the amount of amplitude difference and vice versa, VC1 and VC2 will normally rotate together.

Forward and reflected waves detected by the filter unit are converted to SWR control signals in the SWR arithmetic circuit in the control unit and are sent to the ISW pin of the AT unit. Since the SWR control signals are current waveforms, the signals are converted from I to V waveforms by IC8 (b/4) in the AT unit and to obtain the corresponding voltage mode SWR signals are generated. The SWR signals are then fed into the SWR comparator IC8 (C/4). The reference voltage pin 9 of the IC8 (C/4) is supplied with a voltage corresponding to an SWR of 1.25 to 1 via a potentiometer. Therefore, when the actual SWR value exceeds 1.25, pin 8 of SWR comparator IC8 (C/4) is H, so the motor drive voltage control transistor Q5 turns on and the collector of Q4 is supplied with voltage from pin 14S. The voltage is also used to turn the tuning LED on. The inverted input pin of IC8 (d/4) is supplied with triangular waves generated by IC7, and its non-inverted input pin is supplied with the above SWR voltage signals. As a result, as SWR lowers, IC8 (d/4) outputs

CIRCUIT DESCRIPTION

waves changing from continuous waves to relatively low duty pulses. Q1 is driven by this voltage waveform to control Q2, which is connected to the collector of Q4 in series and motor drive voltage is generated.
If the motor turns too fast, the SWR value will be smaller than the motor stop value because of the inertia of the motor. As a result, the motor will continue to operate even if the motor stop signal is sent and the SWR value will continue to be greater than the motor stop value, causing the motor stop signal to turn off. That is, the motor will not stop and it will be difficult to obtain a match. If the motor speed is too slow, it will take a long time to satisfy a matching condition. The TS-440 therefore controls the motor speed according to changes in SWR.

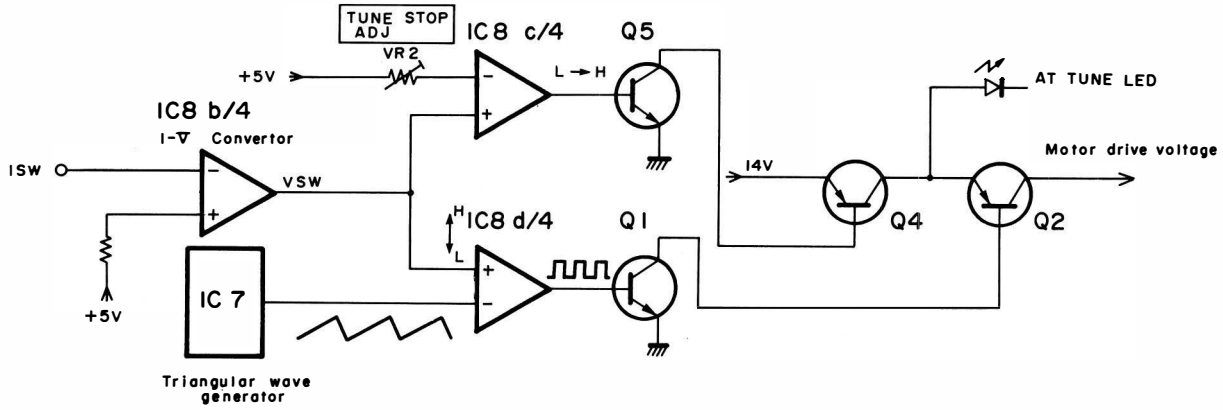

Fig. 7 Antenna tuner circuit

The antenna coupler is a T type. Six relays RL100 to RL105 are used to change taps within the range 3.5 MHz to 30 MHz.

2) Cooling fan circuit

The final unit contains the temperature-sensitive thermistor TH1 thermally coupled with final transistor Q4. When temperature on the surface of Q4 reaches approx. 50°C, the fan start comparator Q9B operates (H level), causing Q8 to turn on to operate the fan. During operation of the fan, temperature protection comparator Q9A is at a L level, so the temperature protection circuit does not operate.
When temperature on the surface of Q4 goes down to 45°C, the cooling fan turns off.

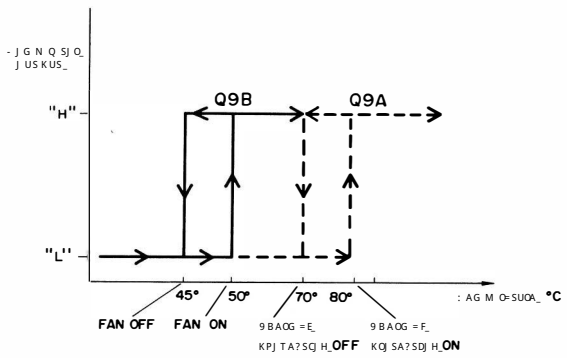

Fig. 8 temperature protection operation

- **Final temperature protection circuit**
  When the temperature of the final transistor Q4 rises up to approx. 80°C, the temperature protection comparator Q9A turns on (H level), Q1 in the filter unit also turns on, and a minus DC voltage is supplied to the ALC line, reducing the transmitter output to zero. (The TS-440 does not return to a receive state.) When the temperature of the final transistor Q4 falls to approx. 70°C, the protection circuits turns off allowing the transmitter to operate again.

- **SWR protection circuit**
  When antenna VSWR is bad, or the reflected wave is too large, because the auto antenna is tuning for example, L42 and L43 detect the state and its output is rectified. The rectified signal is then amplified by Q2 to control the ALC voltage so that drive power is reduced. As a result, load on the final unit is reduced.

- **SWR automatic arithmetic circuit**
  The TS-440 uses the automatic arithmetic circuit in the AT-250. The forward wave voltage V_{SF} and reflected wave voltage V_{SR} from the filter unit are fed into the analog arithmetic circuit of the switch unit, and used to set the voltage level of IC8 pin 2 ($5\ V + V_{SR}/V_{SF}$). Output voltage from the pin 2 is shifted by IC5 to move the needle in the SWR meter.
  IC5 contains a level shift/meter amplifier and an auto tuner V-I convertor. IC7 contains a square wave generator and a voltage comparator. IC8 contains an integration circuit. Q3 and Q4 are used to switch forward and reflected wave input signals alternately.

CIRCUIT DESCRIPTION

V_{SF} is compared with voltage from IC8 pin 6 (5.5 V). When SWR increases, V_{SF} lowers and the voltage level of IC8 pin 8 rises. At IC7 pin 3, a triangular wave is monitored. The triangular wave is compared with the wave from IC8 pin 8 and output. The triangular wave is converted to a square wave by IC10 and sent to switch Q3 and Q4. This voltage is used as the SWR control voltage.

Output voltage from IC8 pin 2 consists of the voltage compared with V_{SR}/V_{SF} and +5 DC voltage. It is distributed to IC4 the level shift/meter amplifier to move the needle in the SWR meter and IC5 the V-I convertor to control the AT440.
VR14 is used to adjust the SWR meter ZERO point.
VR13 is for SWR meter adjustment

3) FULL/SEMI BREAK-IN and VOX circuits

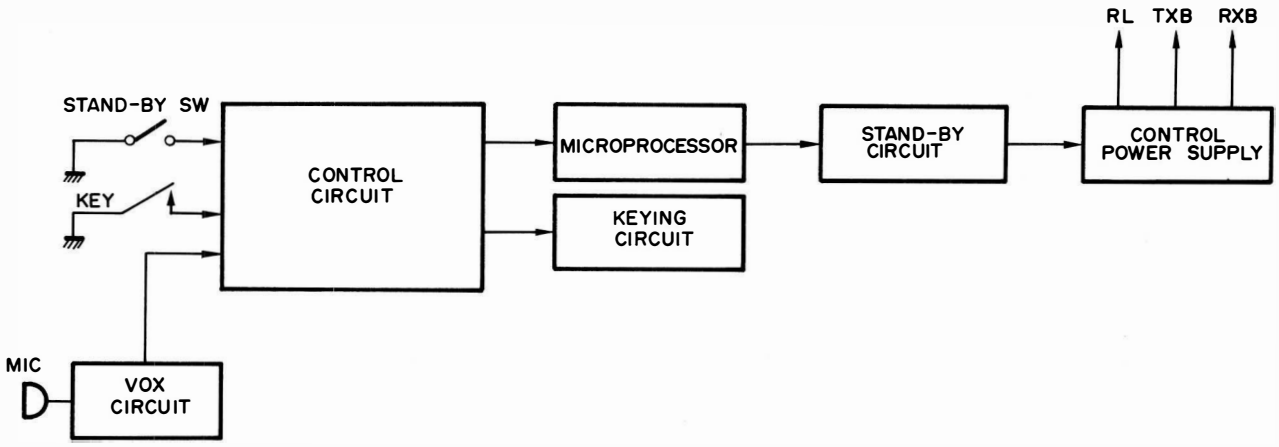

Fig. 9-1 FULL/SEMI BREAK-IN block diagram

When the standby switch, the key, or the VOX switching transistor are activated, a ground is applied to the input pin of the control circuit, which causes a standby signal to be fed to the microprocessor to determine if a valid transmit condition has been met. When that condition has been met, the standby circuit in the IF unit will be turned on.
A keying signal is generated by the control circuit, whenever the key is depressed, to control the keying circuits in the IF unit. This keying signal is also used as the transmit/receive signal during break-in operations.

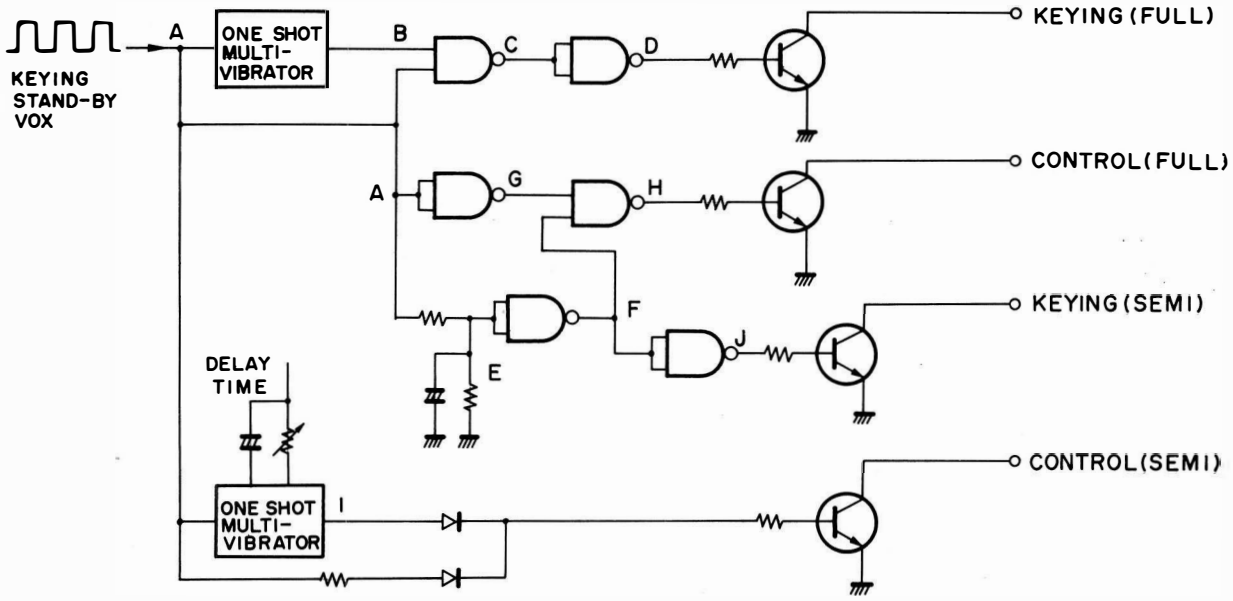

Fig. 9-2 FULL/SEMI BREAK-IN timing chart

CIRCUIT DESCRIPTION

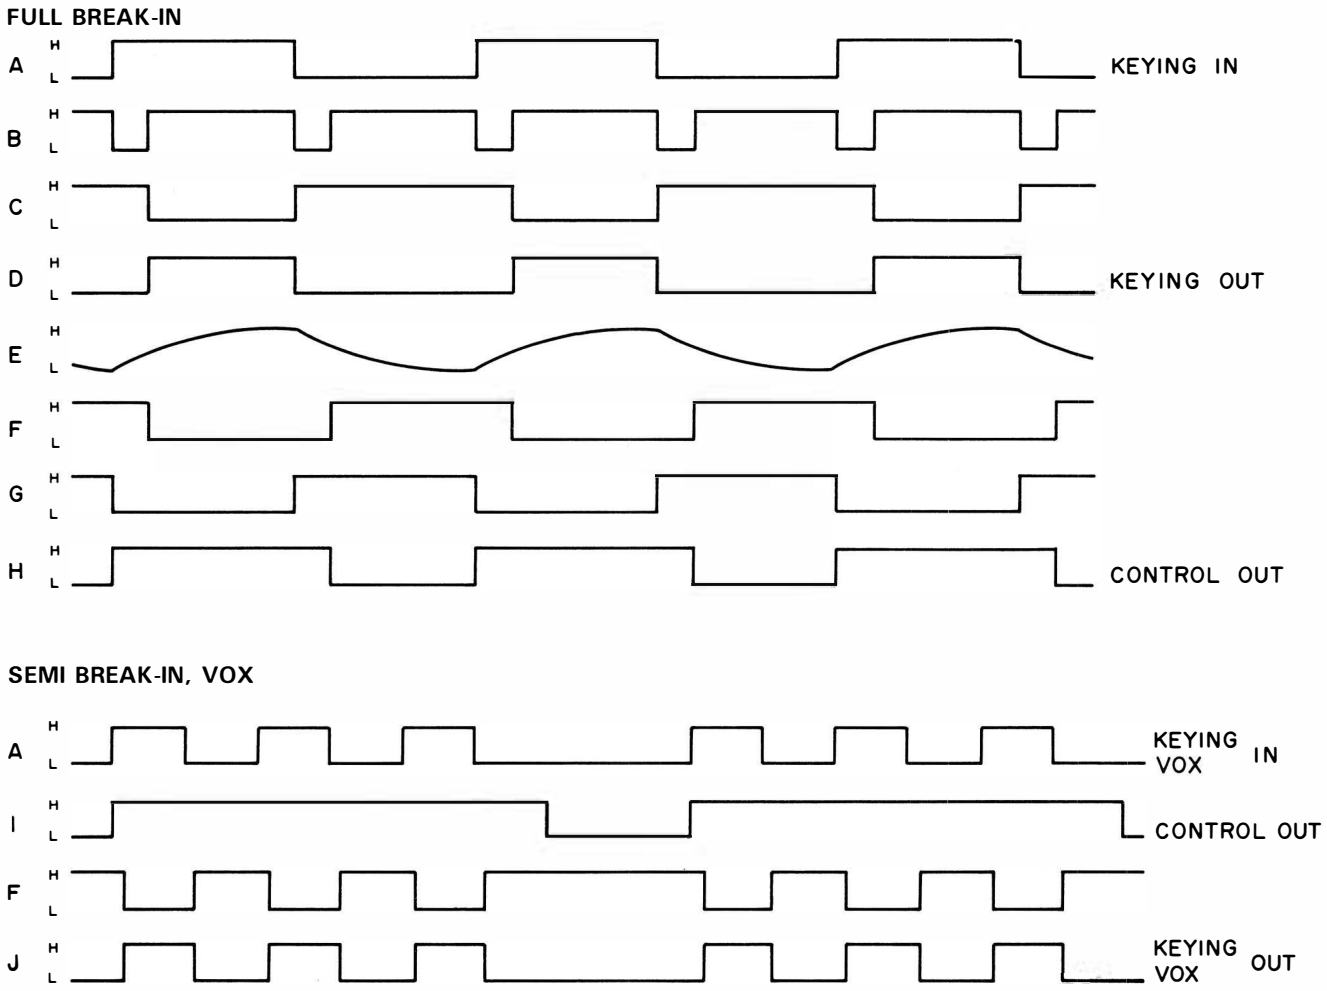

Fig. 9-3 FULL/SEMI BREAK-IN timing chart

The above timing charts show the timing for standby and keying signals.

When an input from the CW key is supplied to point A as shown in the above figure during full break-in operation, the one-shot multi-vibrator and gate circuits generate control (full) and delayed keying (full) signals. After the fundamental timing signal, RL (12V) for reception and transmission rises, the keying wave also rises, and when the key is off, RL falls according to the preset time constant.

Semi-break-in operation is synchronized to VOX. When a signal is supplied to point A, the VOX delay time multivibrator determines the VOX time constant. The input signal is converted to a keying (semi) signal by the gate circuit.

These keying semi/full and control semi/full signals are converted to appropriate break-in VOX mode signals using the slide switch. The control signal is checked by the microcomputer to see whether transmission is to be performed. The control signal is then used to switch CRL in the IF assembly unit and generate RL (12 V). TXB (transmit B+) (8.8 V) is generated, synchronized to RL. The receive control signal RXB (receive B+) (8.8 V) turns on/off, synchronized to the inverted TXB signal, that is, RL.

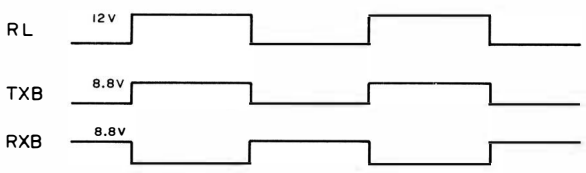

Fig. 10 STANDBY keying timing chart

CIRCUIT DESCRIPTION

4) Speech processor

IC4 in the IF unit functions as the first stage microphone amplifier or audio speech processor. When the processor switch is off, IC4 functions as a 20 dB microphone amplifier. When the processor switch is on, IC4 functions as an up to 40 dB gain amplifier with ALC. When the processor switch is on, 8 VDC is supplied to the base of the gain adjustment switching transistor, Q41, driving the feedback amplifier.

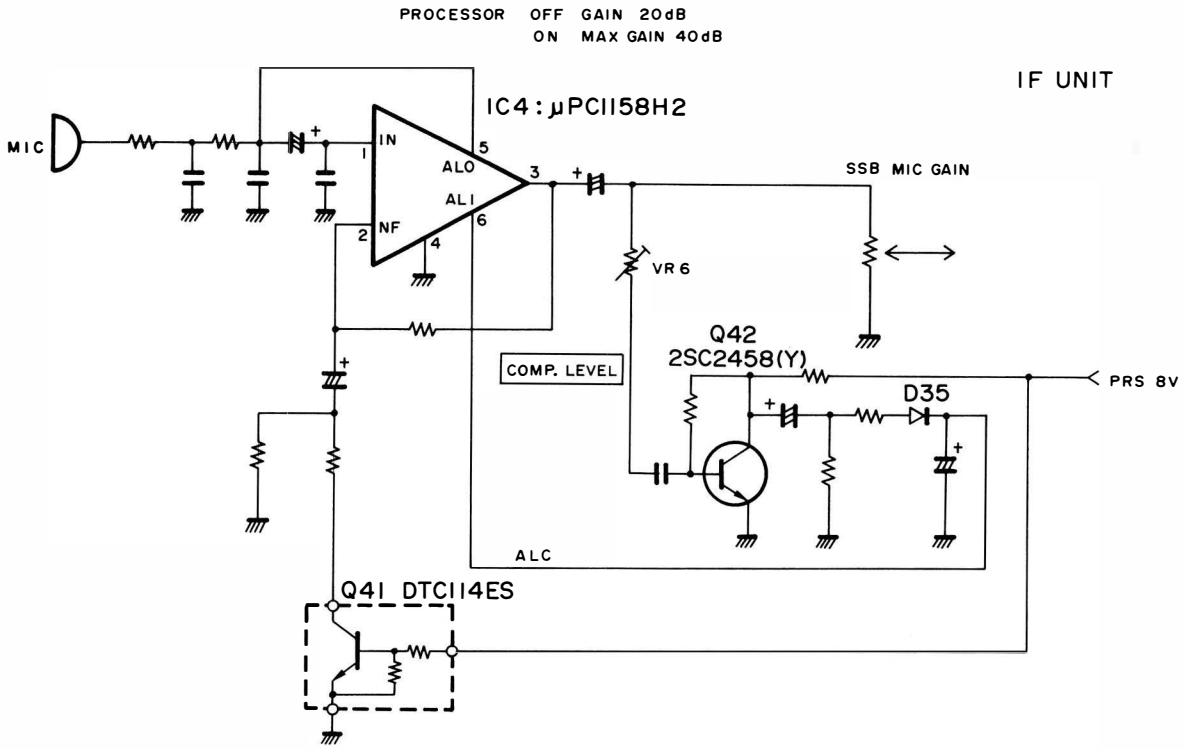

Fig. 11

4. PLL Circuits

Theory of PLL circuit operations

The TS-440 PLL circuit uses a reference frequency of 36 MHz and consists of five PLL loops covering the range of frequencies from 30 kHz to 30 MHz in 10 Hz steps. The PLL circuit has an IF shift function which is implemented by inserting carrier frequencies between PLL loops. The PLL loops include a carrier circuit PLL loop and an HET circuit PLL loop which generates a constant frequency of 36.22 MHz. Frequency division for these PLL loops is controlled by the microprocessor. In all PLL loops phase comparison is made using the reference frequency f_{STD} (frequency control using a single crystal oscillator).

Figure 12 is the PLL circuit block diagram.

The reference frequency (f_{STD}) is generated by a 36 MHz crystal oscillator and Q21 (2SC2787). Reference frequency signals are fed into the main loop's IC11 (SN16913P) via a buffer consisting Q22 and Q23 (2SC2668). The signal is also fed into IC13 (SN74S112) via a buffer consisting of Q24 (2SC2668). In IC13, the signals are frequency divided to generate a 9 MHz signal. The 9 MHz signal is used as the reference frequency signals for the PLL loops.

- **PLL5**

PLL5 consists of IC18 (MN6147) and its associated loop components. VC05,Q36 (2SK192A), is locked at a frequency of 36.22 MHz. The 9 MHz reference frequency signal is supplied to pin 3 of IC18, where the signal is divided by 1800 (450 in FM mode) to generate a 5 kHz (20 kHz in FM mode) signal used for comparison. VCO5's output signal is supplied to IC18 pin 16 via Q37 (2SC2668), where the signals are frequency divided by 7244 (1811 in FM mode). The phase of the signal is then compared with that of the 5 kHz (20 kHz in FM mode) signal by the phase comparator and the VCO5 oscillation frequency is locked. Frequency division data is supplied by digital unit (DA0 to DA3 and CK4).

As described above, the dividing ratio used varies depending on which mode the TS-440 is in, FM mode or SSB. This is because the apparent time constant is increased without changing the active LPF constant so that the PLL signals can be modulated easily and reducing distortion during FM transmission. In modes other than FM, the amount of frequency shift due to mechanical vibrations is reduced because the apparent time constant is reduced. The output from PLL5 goes through buffer Q38 (2SC2668) and LPFs, and is used as the HET signal in the RF unit.

CIRCUIT DESCRIPTION

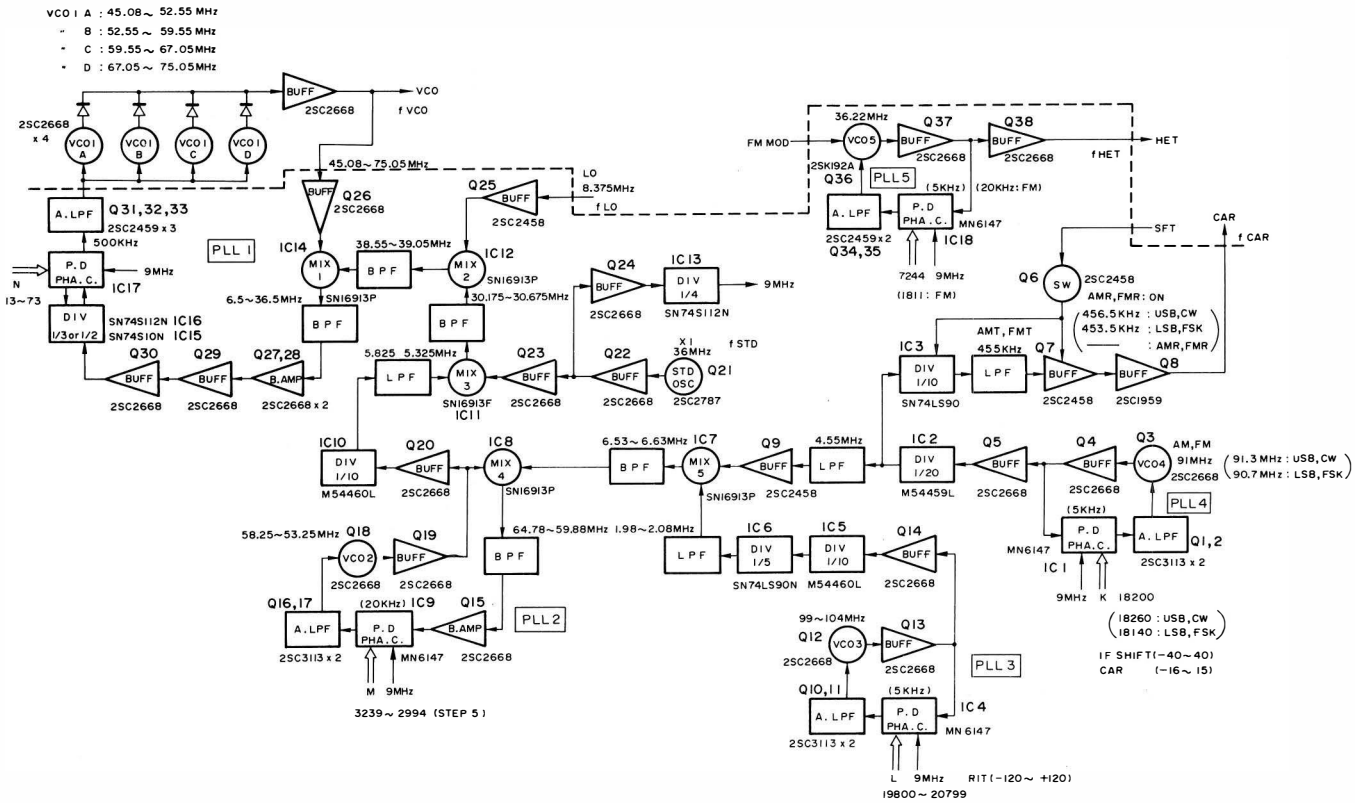

Fig. 12 PLL circuit block diagram

- **PLL4**

PLL4 consists of IC1 (MN6147) and its associated loop circuit. VC04, Q3 (2SC2668), is locked at a frequency of aproximately 91 MHz, which differs depending on the operational mode. The 9 MHz reference frequency is applied to pin 3 of IC1, where the signal is divided by 1800 to generated the 5 kHz signal for frequency comparison. The output of VC04 is supplied to IC1 pin 16 via buffer amplifier Q4 (2SC2668). In IC1, the output is divided by an appropriate division ratio (18200 or so) which differs depending on the mode. The phase of the signal is compared with that of the 5 kHz reference signal by the phase comparator and the VC04 oscillation frequency is locked. Frequency division data is sent from the digital unit (DA0 to DA3 and CK3).

The output from PLL4 goes through buffer amplifier Q5 (2SC2668) and is divided by 20 in IC2 (M54459L). The signal is further divided by ten in the carrier circuit of IC3 (SN74LS90N) and then fed into the IF unit as the carrier signal via the LPF, and buffer Q7 (2SC2458) and Q8 (2SC1959). In AM or FM receive mode, switching circuit Q6 (2SC2458) operates when an SFT signal is sent, and as a result, IC3, Q7, and Q8 are stopped to cut carrier signals.

The PLL4 output signal also goes through the LPF and buffer amplifier Q9 (2SC2458) and is fed into the mixer in the main loop, where the signal is used to form the digital VFO signal. As a result, the operating frequency does not change even if the carrier frequency is changed, which enables USB and LSB mode switching IF shift and fine carrier point adjustment. In SSB, CW, or FSK reception mode, the may be shifted +/− 1 kHz or more and the carrier point can be adjusted in the range from −400 Hz to +350 Hz.

- **PLL3**

PLL3 consists of IC4 (MN6147) and its associated loop components. VC03, Q12 (2SC2668), is locked in the range of 99 MHz to 103.995 MHz. The 9 MHz reference frequency signal is supplied to pin 3 of IC4, where the signal is divided by 1800 to generate the 5 kHz signal for frequency comparison. The output of VC03 goes through buffer amplifier Q13 (2SC2668) and is applied to IC4 pin 16. In IC4, the output is divided by L and the phase of the signal is compared with that of the 5 kHz reference signal by the frequency comparator, and VC03 oscillation frequency is locked (in 5 kHz steps). The division ratio, L, is supplied by the microprocessor, in the digital unit, (DA0 to DA3 and CK2). L is in 1000 steps (19800 to 20799) corresponding to 0.00 kHz to 9.99 kHz. In CW receive, in order to obtain 800 Hz beat signals in the operation frequency display, the L is shifted −80 (19720 to 20719) and when RIT/XIT operates, the L is changed so that f_{VCO} is shifted +/− 1.2 kHz or more. In AM or FM mode, the L is shifted by 10 steps to change f_{VCO} by 100 Hz steps.

Output from PLL 3 goes through buffer amplifier Q14 (2SC2668) and it is divided by ten in IC5 (M54460L) and then by five in IC6 (SN74LS90N). The signal is then fed

CIRCUIT DESCRIPTION

into pin 2 of MIX5 IC7 (SN16913P) via the LPF. In MIX5, the signal is mixed with the signal generated by PLL4 and goes through the BPF to generate a signal in the range of 6.53 MHz to 6.6301 MHz (in 100 Hz steps). The generated signal is supplied to pin 5.

- **PLL2**

PLL2 consists of IC9 (MN6147) and its loop circuitry. VC02, Q18 (2SC2668), is locked in the range of 58.25 MHz to 53.2501 MHz. The 9 MHz reference frequency signal is supplied to pin 3 of IC9, where the signal is divided by 450 to generate a 20 kHz signal for frequency comparison. VC02's output goes through buffer amplifier Q19 (2SC2668), and is fed into MIX4 pin 2 and mixed with the 6.35 MHz to 6.63 MHz signals applied to pin 5. The mixed signal then goes through the BPF to obtain 64.78 MHz to 59.88 MHz signal (in 100 kHz steps). The 64.78 MHz to 59.88 MHz signal is fed into IC9 pin 16 via buffer amplifier Q15 (2SC2668). In IC9, the signal is divided by M, and the phase of signal is compared with that of the 20 kHz reference signal by the phase comparator, and thus MIX4 output is locked (in 100 kHz step). The division ratio M is supplied from the digital unit (DA0 to DA3 and CK1), and is in 50 steps from 3239 to 2994 corresponding to 0.00 MHz to 0.49 MHz.

The output from PLL2 goes through buffer amplifier Q20 (2SC2668) and is divided by ten in IC10 (M54460L). Via the LPF, the signal is fed into pin 2 of MIX3 IC11 (SN16913P). The frequency of the signals depends on the values of L and M, and is in the range of 5.825 MHz to 5.32501 MHz (10 Hz step).

VR1 in MIX4 circuit is used to suppress spurious outputs from the mixer. It is necessary to prevent PLL2 from becoming unlocked.

Signals generated by PLL2 and the 9 MHz reference frequency are mixed in MIX3. The mixed signal goes through the BPF, and is further mixed with f_{Lo} in MIX2 IC12 (SN16913P) on the IF unit. The output from MIX2 goes through the BPF to obtain 38.55 MHz to 39.04999 MHz. The signals are then mixed with the output from the final VCO oscillator in MIX1.

- **PLL1**

The last PLL loop, PLL1, consists of IC17 (MB87006) and its loop components. In IC17, frequency division for reference and comarison frequencies is set by serial data (SO, SCK, and LE). When an external prescaler is used, IC17 has a modulus control function for configuring the pulse swallow counter.

The VCO oscillator output from the RF unit goes through Q26 (2SC2668) in the PLL unit and is fed into MIX1. The mixed signals go through the BPF, and they are then amplified by buffer amplifiers Q27 thru Q30 (2SC2668), shaped by IC15 (SN74S10N1/3), and fed into IC16 (WN74S112N) 1/3, or 1/2 prescaler. Basically, IC16 is a two-level FF circuit and functions as a 1/4 divider. But, when IC17 of the PLL unit sends control signals, to IC16, IC16 functions as a 1/3 or 1/2 frequency divider in conjunction with IC15 (2/3). That is, the IC15, IC16, and IC17 form a pulse swallow frequency divider.

The 9 MHz reference frequency signal is supplied to pin 1 of IC17, where the signals are divided by 18 to generate a 500 kHz signal for frequency comparison. Signals fed into IC17 pin 8 via MIX1 and the buffer amplifier are divided by N, and the phase is compared with that of the 500 kHz reference signals by the phase comparator. The signal then goes through the active LPFs Q31 to Q33 (2SC2459) and is fed into the RF unit as VCO voltage signals to control the variable capacitor of the final VCO. The frequency divider N covers the full range of operating frequencies from 30 kHz to 30 MHz (500 kHz step), and it has 61 steps of frequency division data supplied by the microprocessor in the digital unit.

The last VCO signal in PLL1 therefore depends on the values of L, M, and N, and it is in the range from 45.08 MHz to 75.05 MHz (10 Hz step). N is expressed as follows:

$N = PN_0 - A$
$(N_0 > A)$

P: Prescaler module value
No: Programmable counter value
A: Swallow counter value

PLL IC contains N_0 and A.

The last VCO unit is contained in the RF unit and consists of four VCOs, each handling one portion of frequencies from 30 kHz to 30 MHz. The appropriate VCO is selected by the microprocessor according to band information from the digital unit.

- **Unlock**

If a PLL loop enters a unlock state, the output on the UL pin becomes L. This L signal is sent to the digital unit to stop the microprocessor.

- **500 kHz marker signal**

The 500 kHz reference signal for frequency comparison is supplied from IC17 pin 13, and it is used as the marker reference signal.

5. Digital control circuit

The TS-440 digital control circuit uses an 8-bit CPU (7800) which does not contain ROM, and has a 16K ROM (27128) and a 2K RAM (8418) outside the CPU. A common bus used for data exchange between the CPU and RAM, and between the CPU and ROM and is also connected in parallel to the two 8255's for extended I/O and an 8251 for interface to a personal computer (option). To transfer data to or from an appropriate IC, the CPU uses the WR or RD signal, and the chip select signal from the 74LS138.

The display is dynamically controlled by software, and consists of 13 digits and nine segments. The 13 digit and seven segment signal is driven by the high voltage resistive buffer (6300), and the other two segment signals are driven by a transistor. The 7800 transfers data serially. The clock signal is frequency divided by two in the 4013 and sent to the 6300. Using the 4011 and 4030, the encoder generates count

CIRCUIT DESCRIPTION

pulses and U/D signals from two clock signals which are 90° out of phase with each other, and sends the pulses and signals to the 7800. A clock pulse interrupts the 7800 and a U/D signal causes the 7800 to perform a count up or down operation for each step. If fast rotation occurs, the 7800 processes several steps of PLL data at one time.

Voltages from the RIT and IF shift VRs are converted from analog to digital by the A/D convertor IC (4052) and fed into the 7800. The voltages are used to drive the display and are reflected in the PLL data.

The digital control circuit contains two 8255's for extended I/O. The 8255 in control unit A is an outputonly element and the 8255 in control unit B is an inputonly element for key scan and static data. The output 8255 emits VS-1 signals, PLL data for the 6147, clock signals, and 1 MHz LED data. The input 8255 receives key scan data such as panel switch data and DIP switch data for CAR compensation. It also receives static data which cannot be entered as a portion key scan data.

The 7800 outputs four bits of band and mode information (11 bands in the frequency range from 30 kHz to 30 MHz). Each time the 8251, used as the interface to a personal computer, receives one byte of data, the 7800 is interrupted and reads the data from the 8251. The 7800 analyzes any command in the data. In response to the command, the 7800 controls setting or writes data to the 8251 as required. The 8251 serially sends one byte of data including a start bit, synchronizing to a 4800 Hz clock signal.

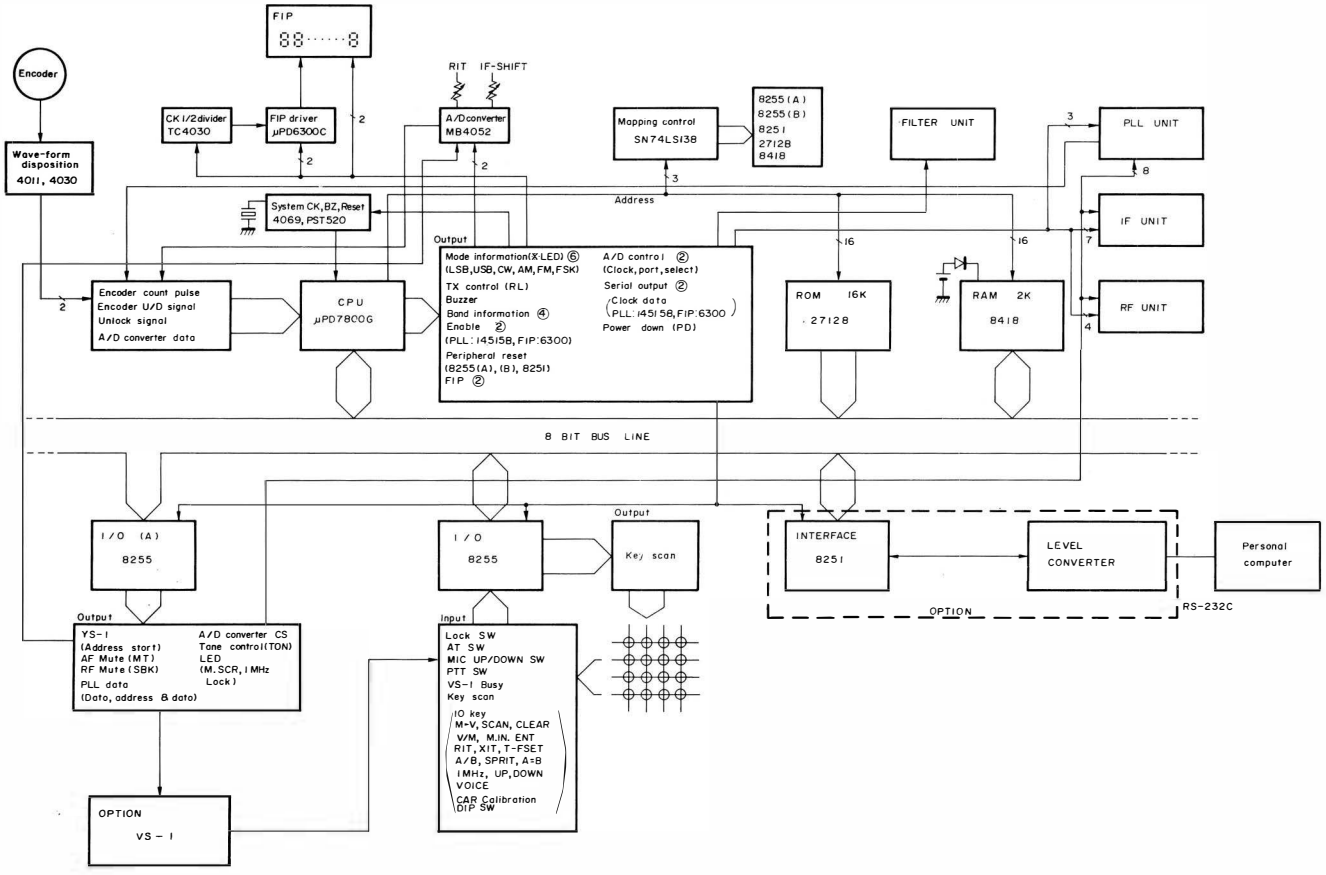

Fig. 13 Control circuit block diagram

CIRCUIT DESCRIPTION

1. Encoder

The TS-440S uses an optical encorder. Two different clock signals from the encoder are 90°, out of phase with each other. This phase difference is not adjustable but depends on the precision of the module. The two clock signals are converted into clock pulses (250 pulses/rotation ×4) and U/D signals indicating the direction of rotation by the 4011 and 4030 and fed into the 7800. Figure 15 is a timing chart for clock pulse and the U/D signal transmitted to the 7800.

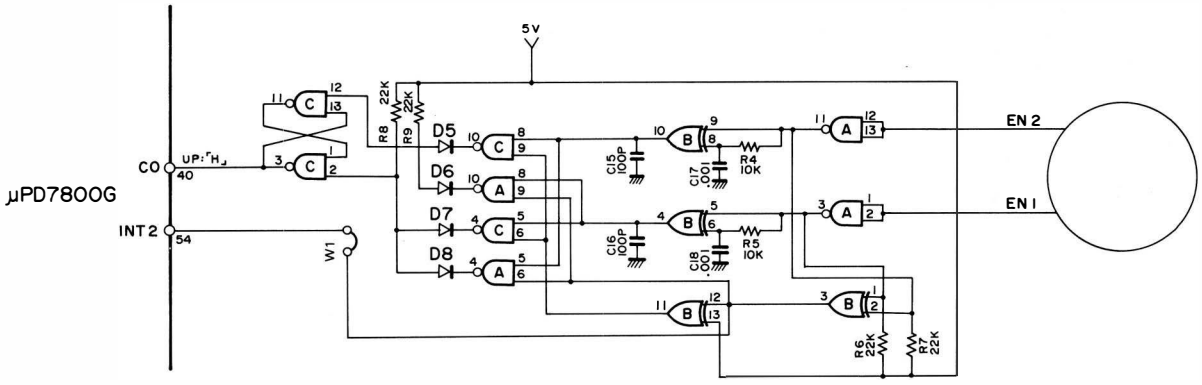

Fig. 14 Encoder circuit

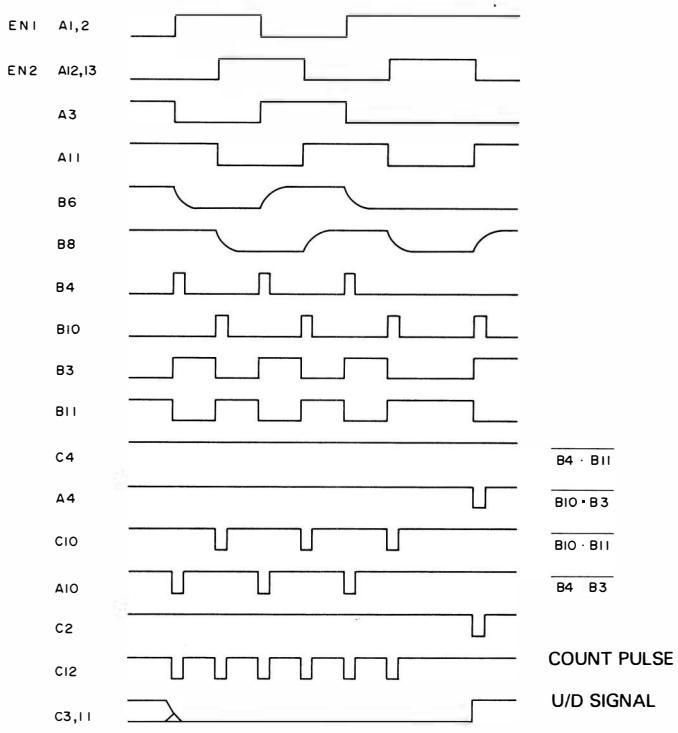

Fig. 15 Encoder waveform timing chart

CIRCUIT DESCRIPTION

2. Digital display

FIP digit and segment signals are driven by the 6300 but decimal point and red character signals are driven by a transistor. 8 V is used to increase the brightness of red characters. The 7800 sends display data serially at 1 MHz, but the clock signals are divided by two (500 kHz) in the 4080 and fed into the 6300. Figure 16 shows how the frequency division is accomplished. The 7800 sends data from its SO pin (pin 28) and a clock signal from its $\overline{SCK}$ pin (pin 26) at approx. 1 ms intervals. After the 7800 has sent 8 bits of data five times, the 7800 sends a negative enable pulse from port B5 (pin 46). When a decimal digit goes on, the 7800 sets port C4 to L and when a red character goes on the 7800 sets port C3 to H.

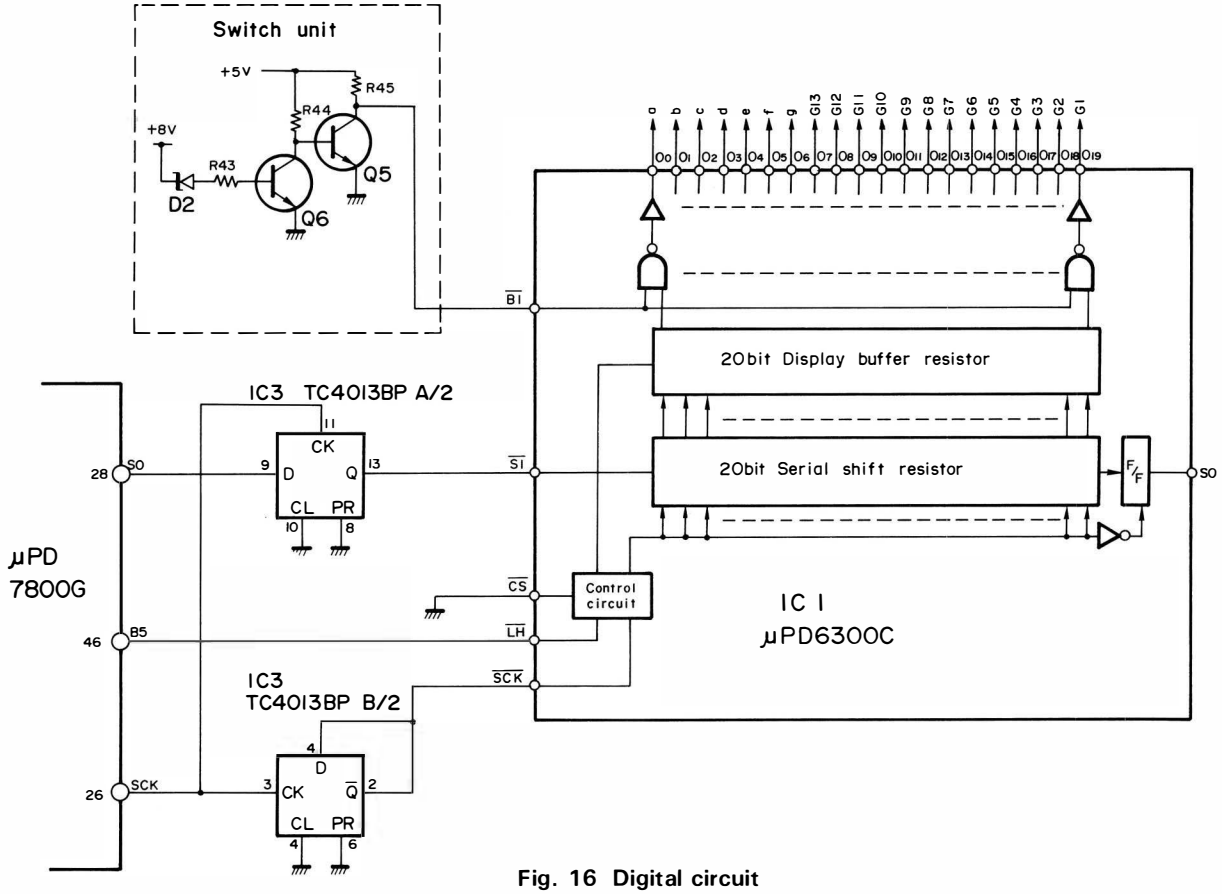

Fig. 16 Digital circuit

3. Key scan input

The key scan input block sends key scan signals (negative pulses) from its 8255 (IC53) port C in the order of C0 to C7 (C6 and C7 are output only once when the POWER switch is turned on). When a matrix crossing point switch is on, its corresponding bit in the 8255 port A is L to enable the switch to be identified. Figure 13 shows the matrix. Key scan S6 and S7 are provided for the extended function using diodes.

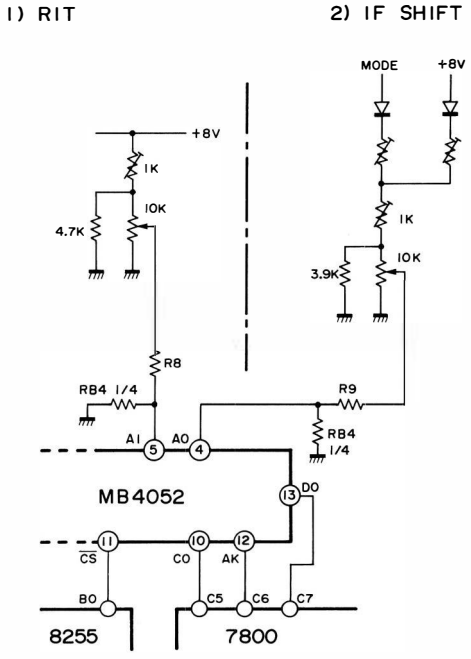
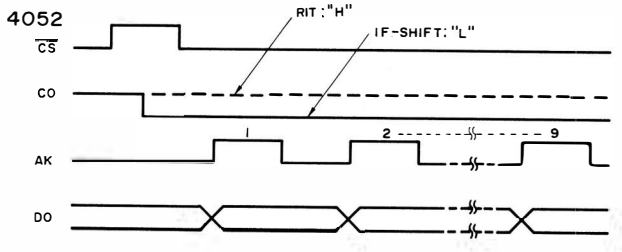
Table 11.

5. A/D convertor input

Voltages controlled by the RIT and IF shift VRs are applied to the 4052 (IC2: Display). The 4052 has four analog inputs: A0 (IC2 pin 4) is connected to the IF shift VR, and A1 (pin 5) is connected to the RIT VR, the other two inputs are not used. When reading IF shift data, the 7800 sets port C5 to 0 and selects 4052 A0. As a result, the 3255 sends a positive pulse from port B0 to reset the 4052, and the 7800 sends nine positive pulses from port C6, and port C7 receives data. When reading RIT data, the 7800 sets C0 from the 4052 to H and thereafter performs the same operations as when reading IF shift data.





A/D converter Input

Fig. 17 A/D convertor circuit

6. AT control

When the AT switch is turned on with the AUTO/THRU switch in the AUTO position, 8255 (IC53) ports B2 and B5 go on. When the 7800 knows that the AT switch is on via port B2, it will enter the CW-mode, and sets port A2 to H and A0, A1, and A3 to A6, and B4 to L, and transfer a power down signal. The 7800 then knows that the PTT switch is on via 8255 port B5, and sets port A6 (transmission control signal) to H, enabling transmission. However, if the selected frequency does not allow the 7800 to prepare for transmission, 7800 port A6 remains L and the 7800 will not enable transmission. When the selected frequency is 1.9 MHz or less, the 7800 will not enter CW mode nor send a power down signal.

7. LED output

Depending on the mode, the 7800 makes the 8255 (IC2) send M, SCR, 1 MHz, and lock LED signals from ports B4, B5, and B6. When the LED goes on, these ports are L. When the mode LED is on, 7800 ports A0 to A5 are H. A0 to A5 correspond to LSB, USB, CW AM, FM, and FSK respectively. Mode LED output is used as mode control signals in the IF unit.

8. VS-1 (option)

When the voice switch is turned on, an address corresponding to the instruction (numerical data) entered is sent from 8255 (IC2) ports A0 to A4 and a positive start pulse signal is sent from port A5. The VS-1 sends busy signals (H) to 8255 (IC53) port B7 while the voice switch is on. After the voice switch goes off, an address corresponding to the next instruction and a start signal are sent.

9. μPD 7800 reset circuit

The 7800 reset circuit is used to initialize the 7800 when the POWER switch is turned on. This circuit supplies a reset pulse to the 7800 after the clock is supplied to the 7800 system clock input, X1 (pin 31). Since IC3 remains on until PST520D (IC3) pin 1 reaches 4.3 V, C10 is not charged, enabling a reset signal to be supplied. When pin 1 exceeds 4.3 V, IC3 goes off, causing C10 to charge via R2 and R3 and the reset signal is removed.

CIRCUIT DESCRIPTION

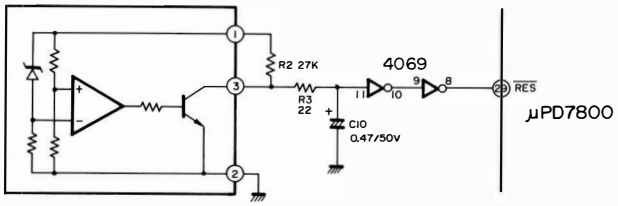


Fig. 18 Reset circuit

10. PLL output block

The PLL output block controls five PLL loops. The 500 kHz step PLL loop uses an MB87006 and the other PLL loops use MN6147s.

The M387006 has two dividers: one for the PLL reference frequency and the other for a swallow type counter. Frequency division data for the reference frequency is sent only one when the TS-440 power is switched on.

The MN6147 uses the PLL data format shown figure 19.

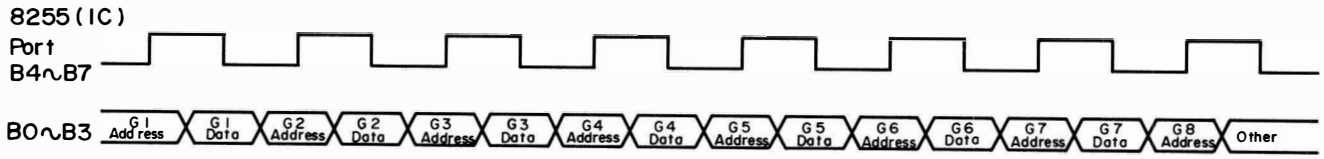

Fig. 19 MN6147 PLL data

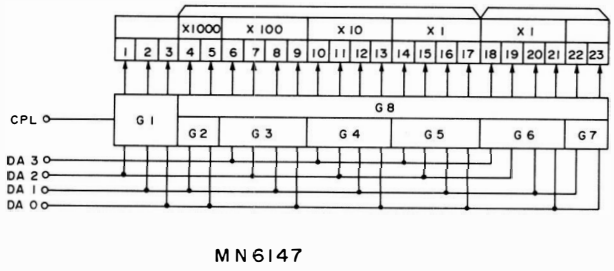
Since the MN6147 has latches as shown in Figure 20, only data following a change is output. G0 data can be any data since it is used to transfer G2 and G7 data to the G8 latch.



MN6147

Fig. 20 Data input terminal and programmable counter

11. Other outputs

RL output (7800 port A6)

This output signal controls transmission. When transmitting, this signal is ''H''.

BZ (Buzzer) output (7800 port A7)

This output signal makes the BZ circuit active. When this signal is ''H'', the oscillator circuit operates.

RESET output (7800 port B7)

This output signal resets the two 8255s and 8251 (option).

SBK output (8255 (IC2) port A6)

This output signal switches the RF unit to prevent noise due to PLL siwtching.

MT output (8255 (IC2) port A7)

This output signal controls the AF output to prevent noise due to PLL siwtching.

SCH output (8255 (IC2) port C0)

This signal controls the sub audible tone encoder. The subtone is activated whenever a transmit frequency in M-CH 90-99 has been selected, in the FM mode. A logic H activates the encoder.

12. CAR compensation DIP switch

This switch is used to compensate the absolute frequency characteristic of the 455 kHz filter. The characteristic can be compensated within the range of −400 Hz to +375 Hz. LSB and USB can be compensated separately. When LSB is compensated, FSK is also compensated.

SW No.	Hz	
1	25	LSB
2	50	
3	100	
4	200	
5	400	
6	25	USB
7	50	
8	100	
9	200	
10	400	

Table 12

When all bits are off, −400 Hz is supplied for compensation. When no compensation is required, bits 5 and 10 must be on.

CIRCUIT DESCRIPTION

13. Band information generation circuit (in the RF unit)

Band information from the control unit is sent to connector 15 of the RF unit. Band information signals B0 to B3 form a BCD code in which B0 corresponds to LSB. Q4D (M74LS145P) is used to convert data from BCD to DEC, and it generates control signals for ten of the 11 bands. Control signals for the remaining band (25.5 MHz to 30 MHz) are generated in the AND circuit consisting of D57, D58, and Q46. These contorl signals go through the current buffer consisting of Q41 to Q45 (M54561P and 2SA562Y), and are OR'ed by diodes, as required, and sent to AT unit, filter unit, C0, and ANT BPF, as shown in Figure 21.

Band information 7800 $PB_0 \sim 3$, $B_3B_2B_1B_0$

30kHz ~ 0.5MHz	0 0 0 0
0.5MHz ~ 1.6MHz	0 0 0 1

Table 13

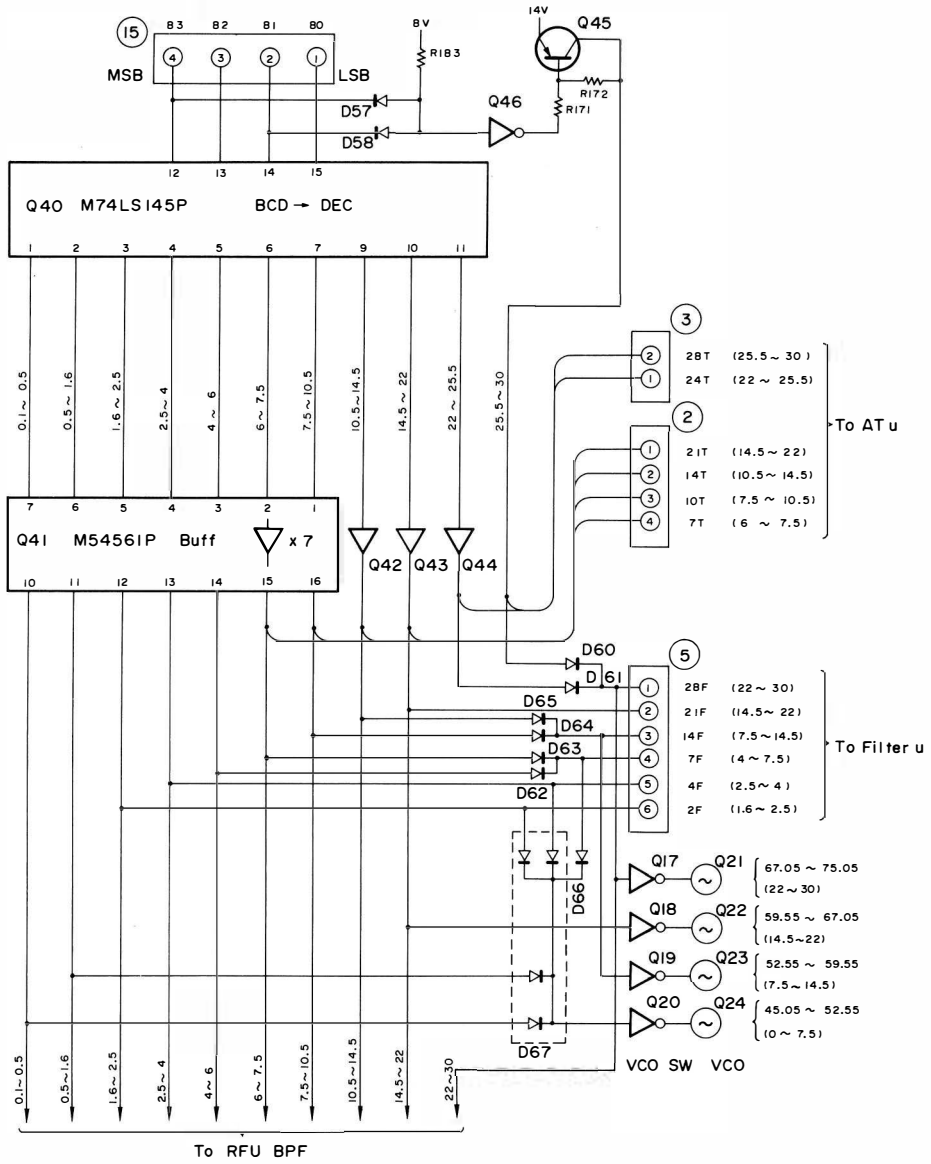

Fig. 21 Band information generation circuit

CIRCUIT DESCRIPTION

14. Mode control signals

Transmit/receive mode signals are generated by IC10 in the IF unit. IC10 is a hybrid IC containing five pairs of PNP transistors and diodes.
Figure 22 shows its equivalent circuit. When the mode signals SSB, CWB, RYB, AMB, and FMB are applied to pins 6 to 10, the voltages of control pins 16 and 17 change. During reception, these signals change to SSR, CWR, RYR, AMR, and FMR. During transmission, these signals change to SST, CWT, RYT, AMT, and FMT.

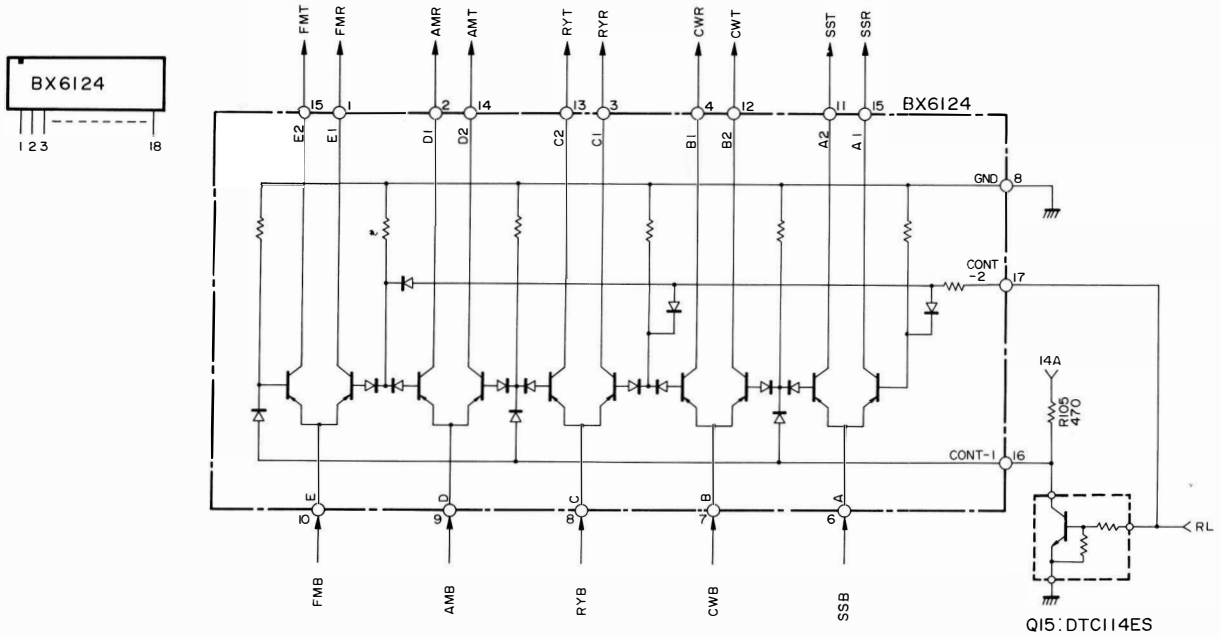

Fig. 22 Mode control circuit

15. Expand function

Control unit (X53-1450- 11)

78	W 24 TX	No	Yes
79	W 18 TX	No	Yes

Table 14 Expand function

CIRCUIT DESCRIPTION

16. Semi-self test function

Semi-self test is started by turning the POWER switch on with the [4] (AM) and T-F SET switches pressed.

This test provides a method of testing the TS-440 digital system in a shorter time during production or servicing. The test enables the following:

1. Circuits which are difficult to test during program execution to be tested easily. For example, dynamic data can be ouput as static data.
2. Items on which information is held only by the CPU and is not available to the user to be tested.
   a. Approximately threshold level input
   b. Incorrect input due to input pin fault

Operation procedure

1. POWER SW OFF
2. The power switch on while pushing switch [4] (AM) and switch T-F SET
3. The test number has starts from ''0'' to ''56'' and END when turn the VFO knob clockwise.
   Operation chart shows as follow.
4. To reset SEMI-SELF TEST function, Power switch OFF.

TEST NO. LIST

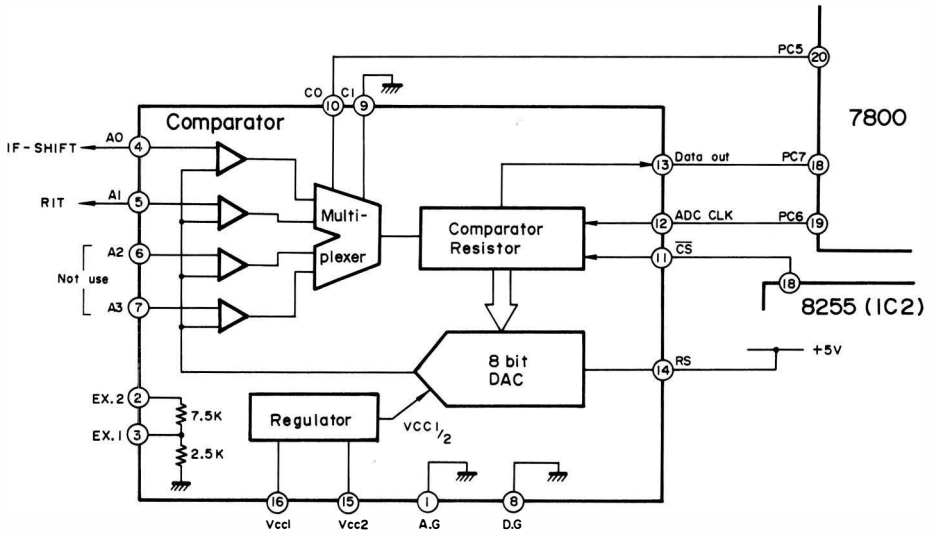
MB4052



MB4052 Pin Description

I/O Signal Pin Functions

Pin No.	Pin Name	Symbol	Function
2 3	Range expander input Range expander output	Ex. 2 Ex. 1	Analog input pin for expanding the range. Analog output pin for expanding the range. Connect to any pin from A0 to A3. By using Ex. 1, Ex. 2, the range is expanded to the ×4 range.
4 ~ 7	Analog entrance	$A_0 \sim A_3$	4-ch analog input pin. Channel 1 is selected by channel select input C0 to C1.
9 10	Channel select input	C_0 C_1	The input pin to designate the analog input channel for A/D converter. This signal is latched at the trailing edge of $\overline{CS}$.
11	Chip select input	$\overline{CS}$	This is the chip select input pin. When $\overline{CS}$ is inverted from "1" to "0", A/D converting starts and data output is enabled. After A/D converting is over or when an interrupt is required, set the $\overline{CS}$ back to "1".
12	A/D convertion clock	ADC CLK	This is the clock input pin for A/D convertion input to the comparator register sequentially. Convertion speed is determined by the clock speed. In the case of 8-bit, approx. 10 clocks will be needed. However, it is not necessary that the clock period be fixed.
13	Data output	DATA OUT	This is the open collector to output the result of A/D convertion. The data is output in the order of the start bit, most significant bit, 2nd significant bit, ..., least significant bit, and the stop bit, synchronized with ADCCLK.
14	Range select input	RS	This is the input pin for selecting the voltage range of analog input. The VFS = $Vcc_1/8$ range is selected at "0", and the range of FVS = $Vcc_1/2$ is selected at "1". During convertion, hold this pin to "0" or "1".
1 8	Analog ground Digital ground	A.G D.G	Ground terminal
15 16	Power supply pin 2 Power supply pin 1	Vcc_2 Vcc_1	When driving with 3.5 to 6.0 V of power, connect Vcc_1 and Vcc_2 to each other, and apply the power voltage to them. When driving 8 to 18 V of power, apply the power voltage to Vcc_2. At this time, the 5 V stabilized voltage is output to Vcc_1, and approx. 10 mA current can be supplied externally to the IC. When either 3.5 ~ 6.0 V or 8 ~ 18V power is used, Vcc_1 is the reference voltage for A/D convertion.

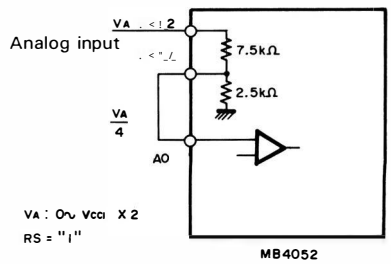
- **Channel Select**

C_1	C_0	Selected Ch.
0	0	A_0
0	1	A_1
1	0	A_2
1	1	A_3

- **Range select**

RS	Convertion voltage range
0	$0 \sim \frac{Vcc_1}{8}$
1	$0 \sim \frac{Vcc_1}{2}$

- **Wiring example when expanding the range**



SEMICONDUCTOR

μPD6300C (Display unit IC1)

Pin description

Pin No.	Symbol	Pin name	I/O	Description
1 7	O_{13} O_{14} O_{15} O_{16} O_{17} O_{18} O_{19}	FIP Segment driver (O_{13}~O_{19})	O	High dielectric-strength (40V) output in the Pch open. Corresponds to the output of Q_{13}~Q_{19}
8	SO	Serial data output pin	O	Output serial data the trailing edge of SCK. When the n-number of μPD6300Cs are connected in series, this can be connected to the SI of the following stage.
9	$\overline{BI}$	Blanking pin	I	This input can turn off all indicator or displays, and can dim them by applying a random duty pulse from outside. Active low.
10	$\overline{LH}$	Latch pin	I	Transmits the connects of the serial shift register to the buffer register at low level, to latch the connects at the rising time. Active rising (leading) edge.
11	SI	Serial data input pin	I	This is the data input pin. Inputs data to the shift register at the rising edge of $\overline{SCK}$.
12	$\overline{SCK}$	Serial clock input pin	I	Reads out the SI data to the shift register at the rising edge of $\overline{SCK}$. Outputs data from SO at the trailing edge of $\overline{SCK}$.
13	$\overline{CS}$	Chip select pin	I	When $\overline{CS}$ is high, this inhibits $\overline{SCK}$ and $\overline{LH}$, and when $\overline{CS}$ is low, activates $\overline{SCK}$ and $\overline{LH}$.
14	V_{SS}	GND	—	Connect to the GND terminal of the system.
15 16 17 18 26 27	O_0 O_1 O_2 O_3 O_4 O_5 O_6 O_7 O_8 O_9 O_{10} O_{11} O_{12}	FIP Segment driver (O_0~O_{12})		Pch open-drain system, high dielectric-strength output. Corresponds to the output of O_0 to O_{12} 28	V_{DD}	Power supply pin	—	5 V ± 10%

REQUIRED TEST EQUIPMENT

1. **DC Voltmeter (DC V.M)**
   1) Input resistance: More than 1MΩ
   2) Voltage range: 1.5 to 1000V AC/DC
   NOTE: A high-precision multimeter may be used. However, accurate reading can not be obtained for high-impedance circuits.
2. **DC Ammeter**
   1) Current range: 1.5A, 3A, 20A, High-precision ammeter may be used.
3. **RF VTVM (RF V.M)**
   1) Input impedance: 1MΩ and less than 3pF, min.
   2) Voltage range: 10mV to 300V
   3) Frequency range: 10kHz to 100MHz or greater
4. **AF Voltmeter (AF V.M)**
   1) Frequency range: 50Hz to 10kHz
   2) Input resistance: 1MΩ or greater
   3) Voltage range: 10mV to 30V
5. **AF Generator (AG)**
   1) Frequency range: 200Hz to 5kHz
   2) Output: 1mV or less to 1V, low distortion
6. **AF Dummy Load**
   1) Impedance: 8Ω
   2) Dissipation: 3W or greater
7. **Oscilloscope (SCOPE)**
   Requires high sensitivity, and external synchronization capability.
8. **Sweep Generator (SWEEP)**
   1) Center frequency: 50kHz to 90MHz
   2) Frequency deviation: Maximum ± 35MHz
   3) Output voltage: 0.1V or greater
9. **Standard Signal Generator (SSG)**
   1) Frequency range: 50kHz to 50MHz
   2) Output: −20dB/0.1μV to 120dB/1V
   3) Output impedance: 50Ω
   4) AM and FM modulation can be possible.
   NOTE: Generator must be frequency stable.
10. **Frequency Counter (f. counter)**
    1) Minimum input voltage: 50mV
    2) Frequency range: 50MHz or greater
11. **Noise Generator**
    Must generate ignition noise containing harmonics beyond 30MHz.
12. **RF Dummy Load**
    1) Impedance: 150Ω and 20Ω
    2) Dissipation: 150W or greater
13. **Power Meter**
    1) Impedance: 50Ω
    2) Dissipation: 150W cintinuous or greater
    3) Frequency limits: 60MHz or greater

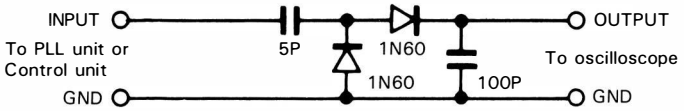
ADJUSTMENT

14. Spectrum Analyzer (SPE-ANA)

1) Frequency range: 100kHz to 110MHz or greater
2) Bandwidth: 1kHz to 3MHz

15. Detector

1) For adjustment of PLL/VCO BPF



16. Directional Coupler

17. Power supply

PS-430

18. Microphone

MC-60A or MC-42S

ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specification/Remarks
		Test equipment	Unit	Terminal	Unit	Part	Method	
	2) AT-TUNE SW: OFF Disconnect No.① connector from AT unit. STBY: SEND Set. SWR 1.25 reading when VFO dial is turned.	Set as shown right.						
	3) STBY: REC AT TUNE: ON				AT	VR2	Adjust VR2 until AT TUNE indicator just goes off.	
	4) AF TUNE: OFF Reconnect No.① connector after adjustment.							

ADJUSTMENT

MICROPROCESSOR OPERATION CHECK

Item	Condition	Operation check
1. Reset check	1) FUNCTION SW: A POWER SW: OFF Set the POWER SW ON while depressing the [A=B] key. Then release the [A=B] key.	FREQ: 14,000.0kHz MODE: USB VFO A: Lights The "Beeper" sound simultaneously with POWER ON.
	2) FUNCTION SW: B	FREQ: 14,000.0kHz MODE: USB VFO B: Lights
	3) [VFO/M] SW: ON M.CH SW: Change the channels in 00 through 99 order.	The frequency display disappears. M.CH display lights and displays 00—99 order. Split display lights when turning VFO dial 90—99.
2. Band	1) [VFO/M] SW: OFF 1MHz STEP SW: OFF Depress the "BAND : UP" key once. Press repeatedly.	FREQ : [1][8], [0]00.0kHz The "Beeper" sounds simultaneously. The MHz display □ □ , □ counts up. The "Beeper" soudns simultaneously.
	2) Hold the "BAND : UP" on.	FREQ: 14,000.0 → 18,000.0 ↓ 10,000.0 ↑ 21,000.0 ↓ 7,000.0 ↑ 24,500.0 ↓ 3,500.0 ↑ 28,500.0 ↓ 1,500.0 ↑ 29,500.0 The "Beeper" sounds at each Key-press.
	3) Depress the "BAND: DOWN" key once. Repeat the operation.	FREQ: □ □ , □ 00.0kHz Displays 1MHz lower frequency than that previously displayed in 2). The "Beeper" sounds. The frequency display steps down 1MHz at each key-press. The "Beeper" sounds.
	4) Hold the "BAND: DOWN" key on.	The frequency display in 2) steps down. The "Beeper" sounds at each key-press.
	5) 1MHz STEP SW: ON Hold the "UP" key on.	1MHz LED (green) lights. FREQ: □ □ ,000.0kHz The MHz display □ □ advances 1MHz at each key-press.
	Hold the "DOWN" key on.	The display steps down 1MHz at each key-press.

Item	Condition	Operation check
3. Dial	1) FREQ: 0,000.0kHz ① Check to see if the display does not change by turning the VFO control counterclockwise. And adjust the index by turning it in the same way. ② Turn the VFO control slowly clockwise.	
4. MODE function (LSB, USB, CW, AF, FM, FSK)	Change MODE (ex: depress CW once)	CW "C" morse code —·—· EX: LSB ·—·· USB ··—— CW —·—· AM ·—— FM ··—· FSK ·—· LED lights when depressing MODE SW.
5. [ENT] KEY	1) Depress the [ENT] once. 	The frequency display disappears. - - - - - - - - Seven bar's segment and two decimal point displayed.
	2) Depress MODE/KEY [1][6][7][8][9][ENT]	FREQ: 16.7890MHz The "Beeper" sounds simultaneously.
6. Memory write 100 CH memory 00—89: NORMAL 91—99: SPLIT CH	1) FREQ: 14.0000MHz MODE: USB [VFO/M] SW: ON	The frequency displays disappears. M.CH 00 (Two decimal point only) M.CH display lights and displays 00 in order.
	2) Repeat VFO/M SW: ON	FREQ: 14.0000MHz The "Beeper" sounds simultaneously.
	3) [M.IN] SW: ON	The frequency display disappears. M.CH display lights and displays 00 in order. M.SCR LED light.
	4) [M.IN] SW: ON again	FREQ: 14.0000MHz (Memory is written already)
	5) VFO/M SW: ON	FREQ 14.0000 MHz M.CH display lights and displays 00 in order.

ADJUSTMENT

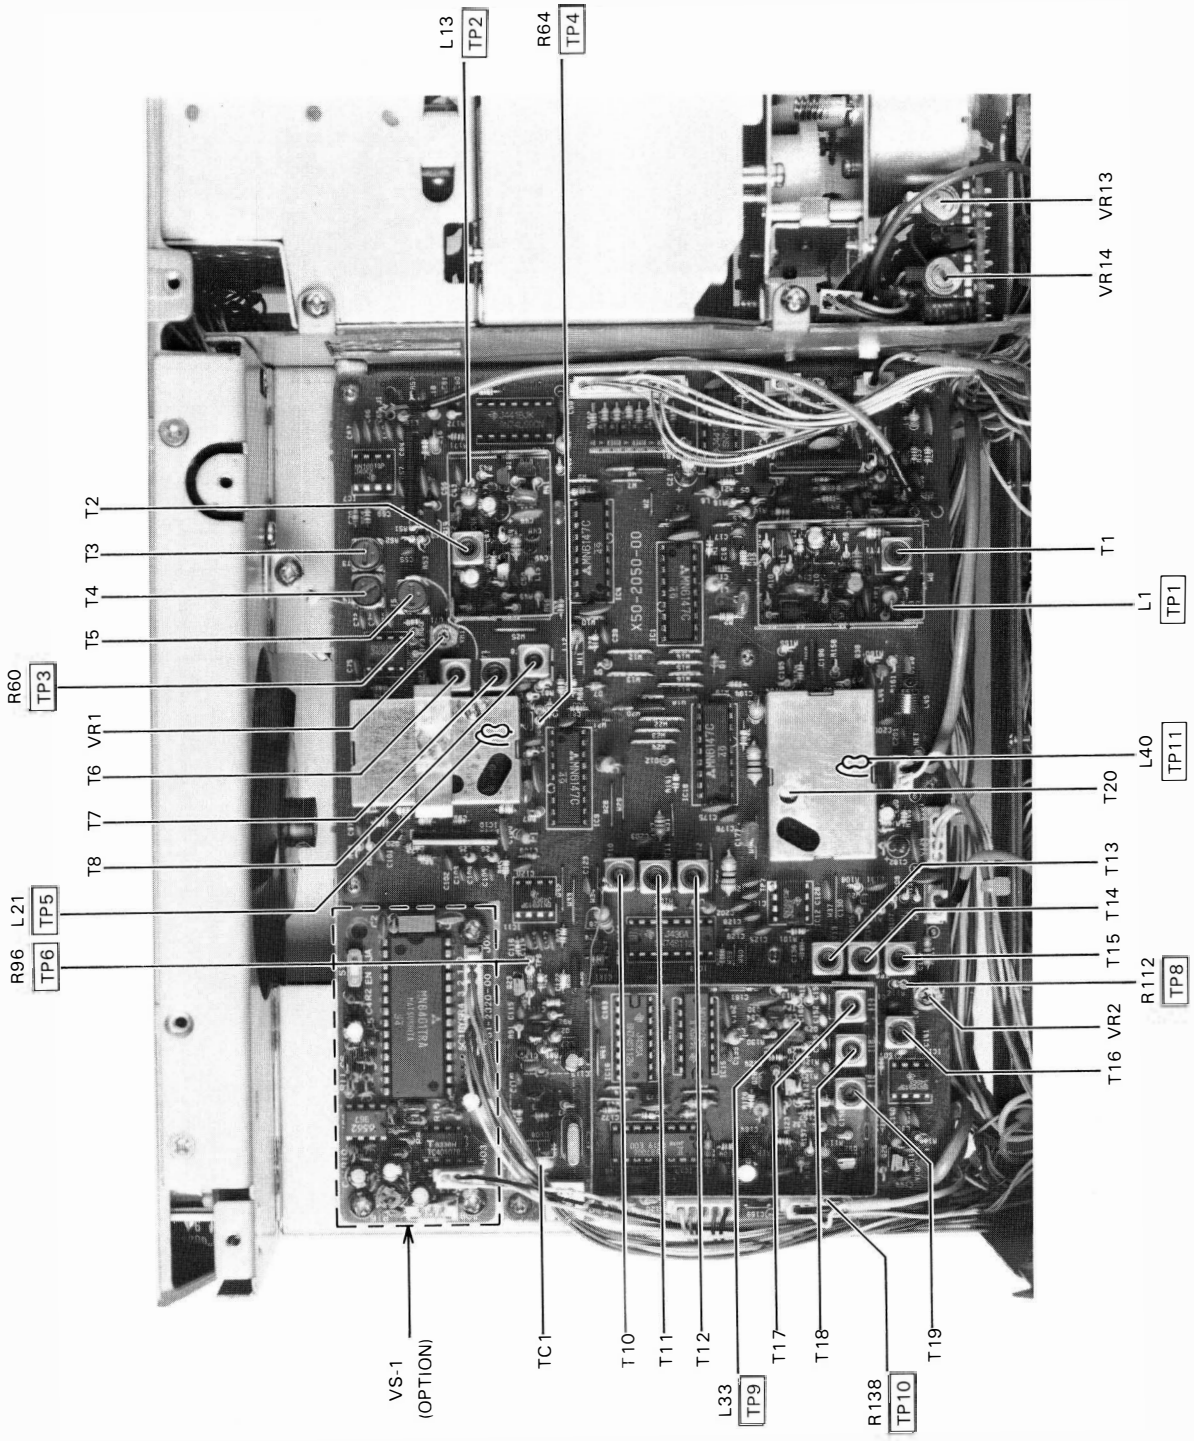
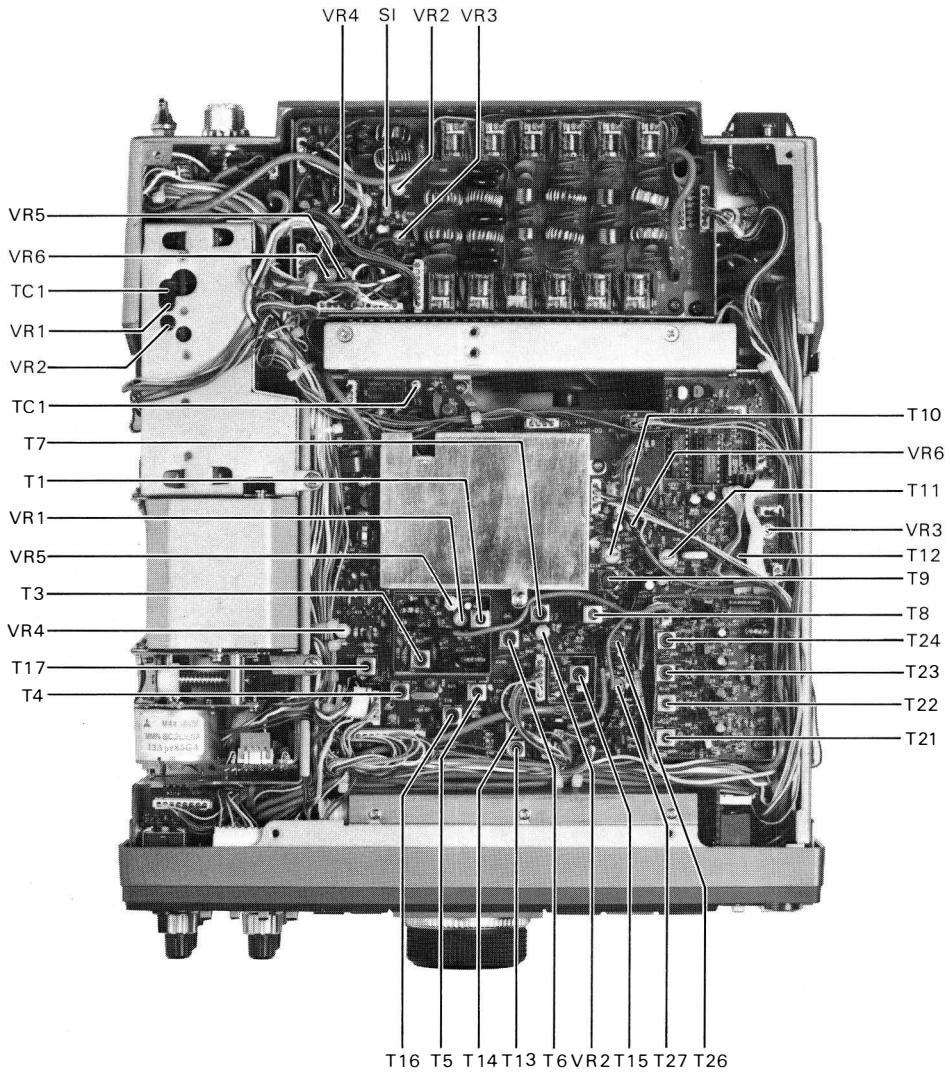
ADJUSTMENT

INNER VIEW

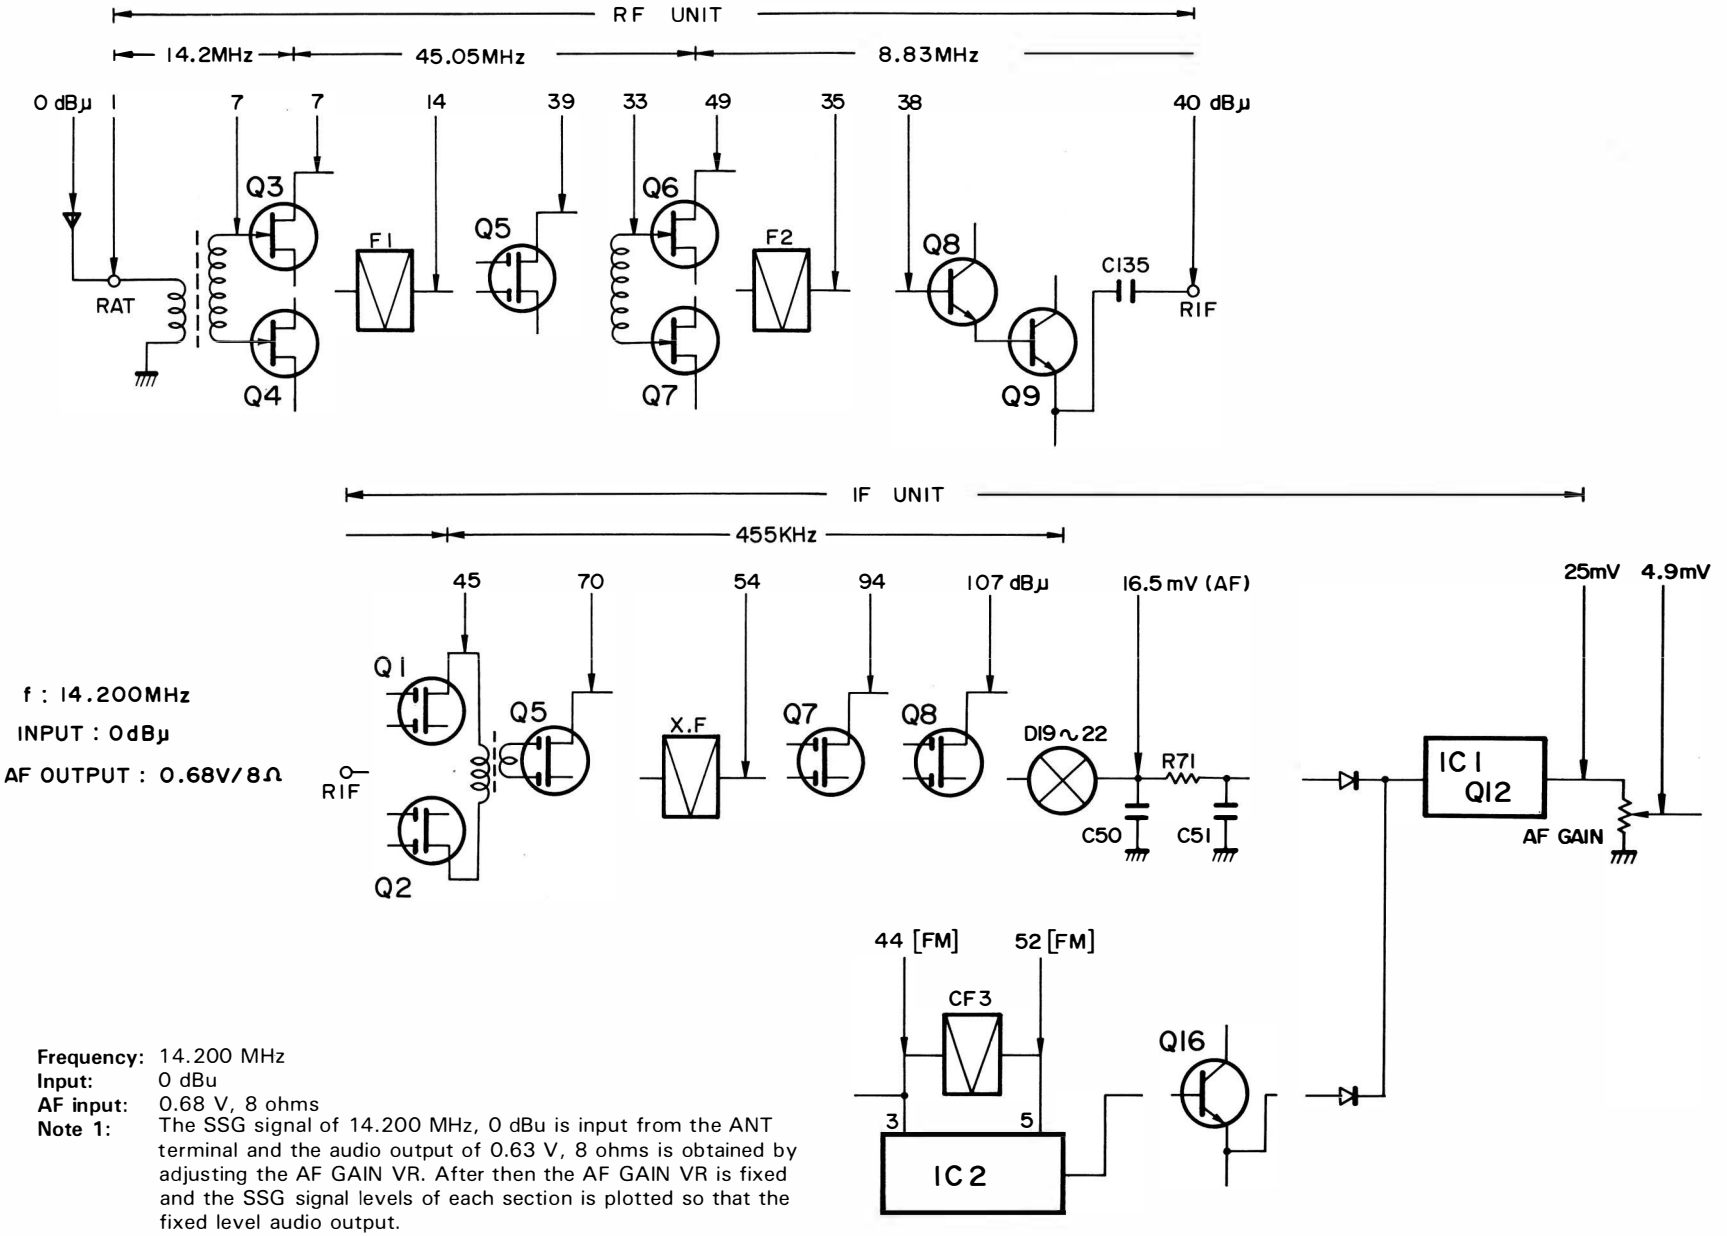


ADJUSTMENT

BOTTOM VIEW



RX SECTION



f : 14.200MHz
INPUT : 0dBμ
AF OUTPUT : 0.68V/8Ω

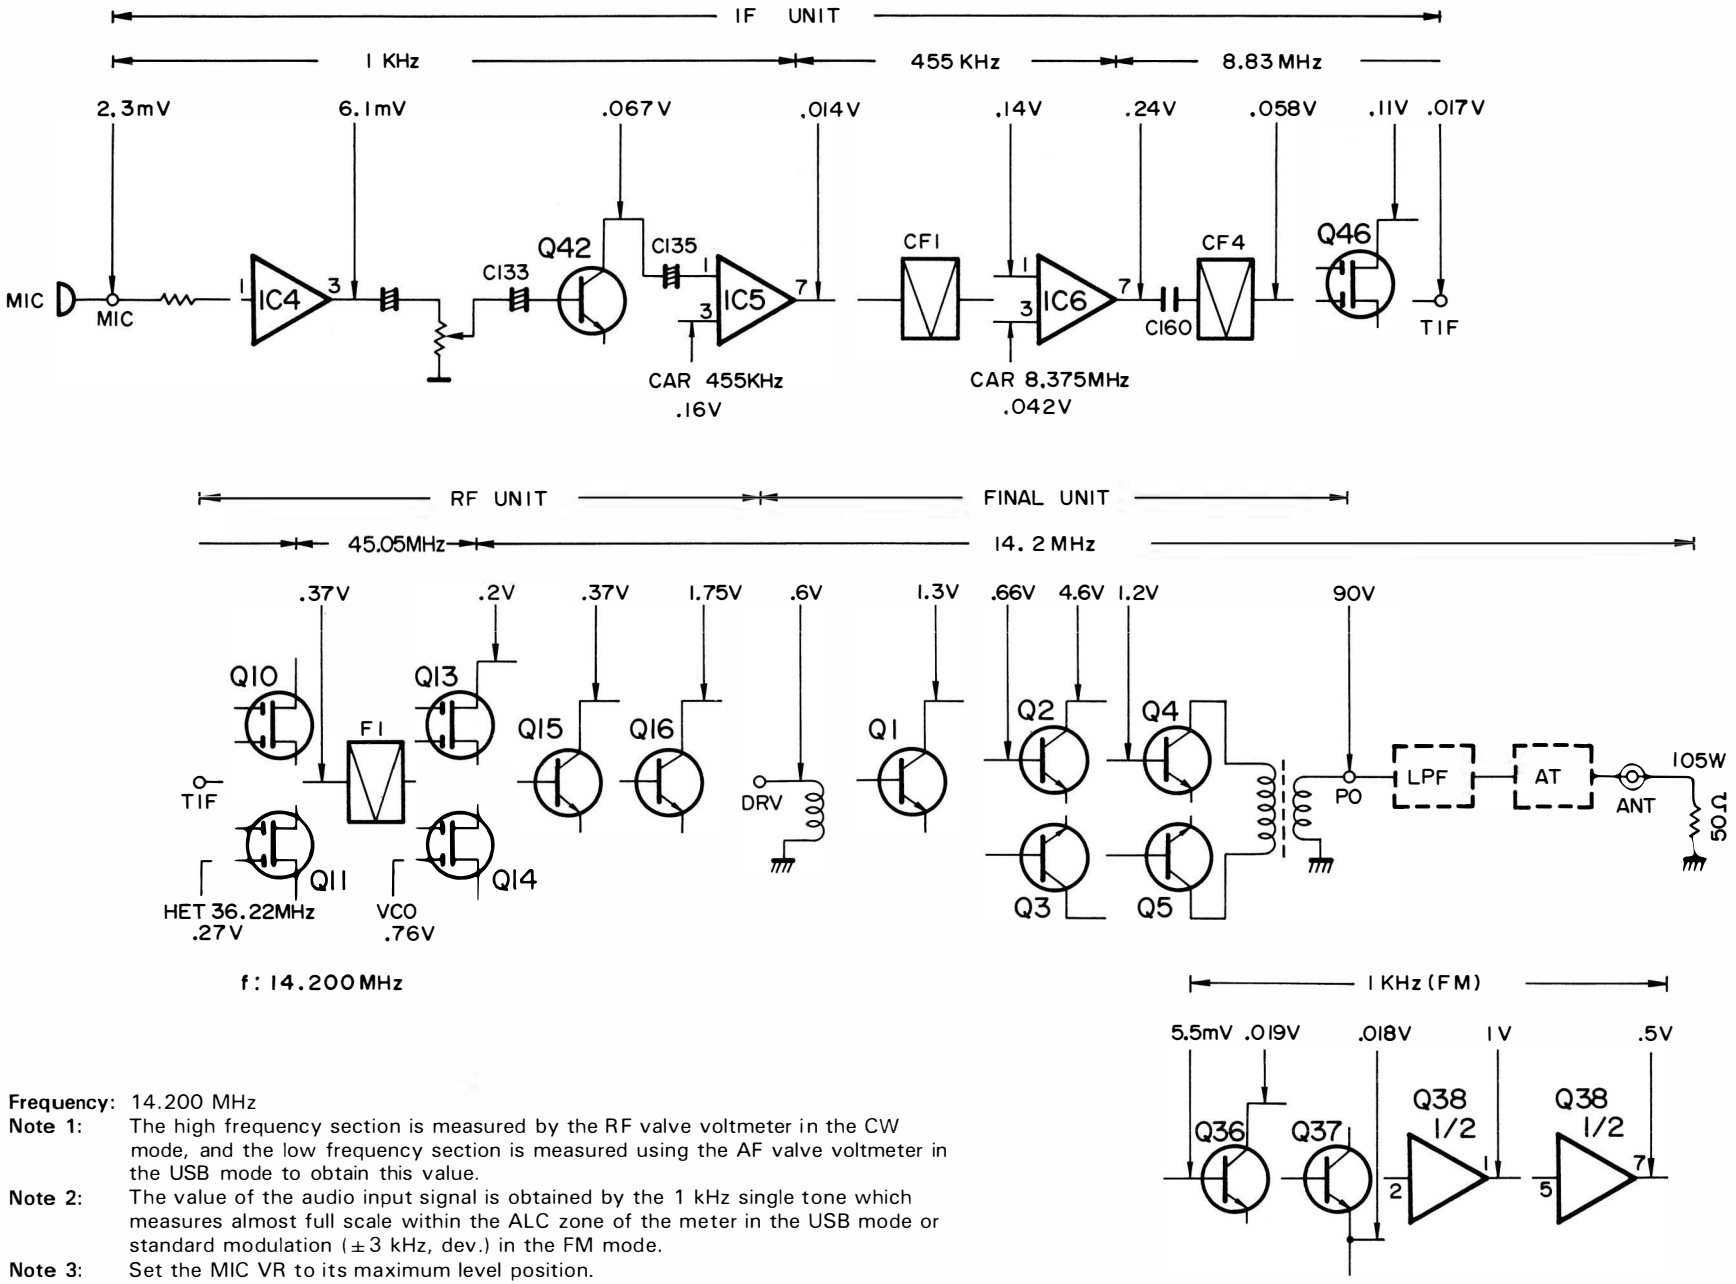
Frequency: 14.200 MHz
Input: 0 dBu
AF input: 0.68 V, 8 ohms

Note 1: The SSG signal of 14.200 MHz, 0 dBu is input from the ANT terminal and the audio output of 0.63 V, 8 ohms is obtained by adjusting the AF GAIN VR. After then the AF GAIN VR is fixed and the SSG signal levels of each section is plotted so that the fixed level audio output.

Note 2: In the FM mode, this is the signal level to obtain the same value as the S/N ratio at 0 dBu signal input.

Note 3: The SSG output is measured through 0.01 uF ceramic capacitor (barium titanate capacitor).

TX SECTION



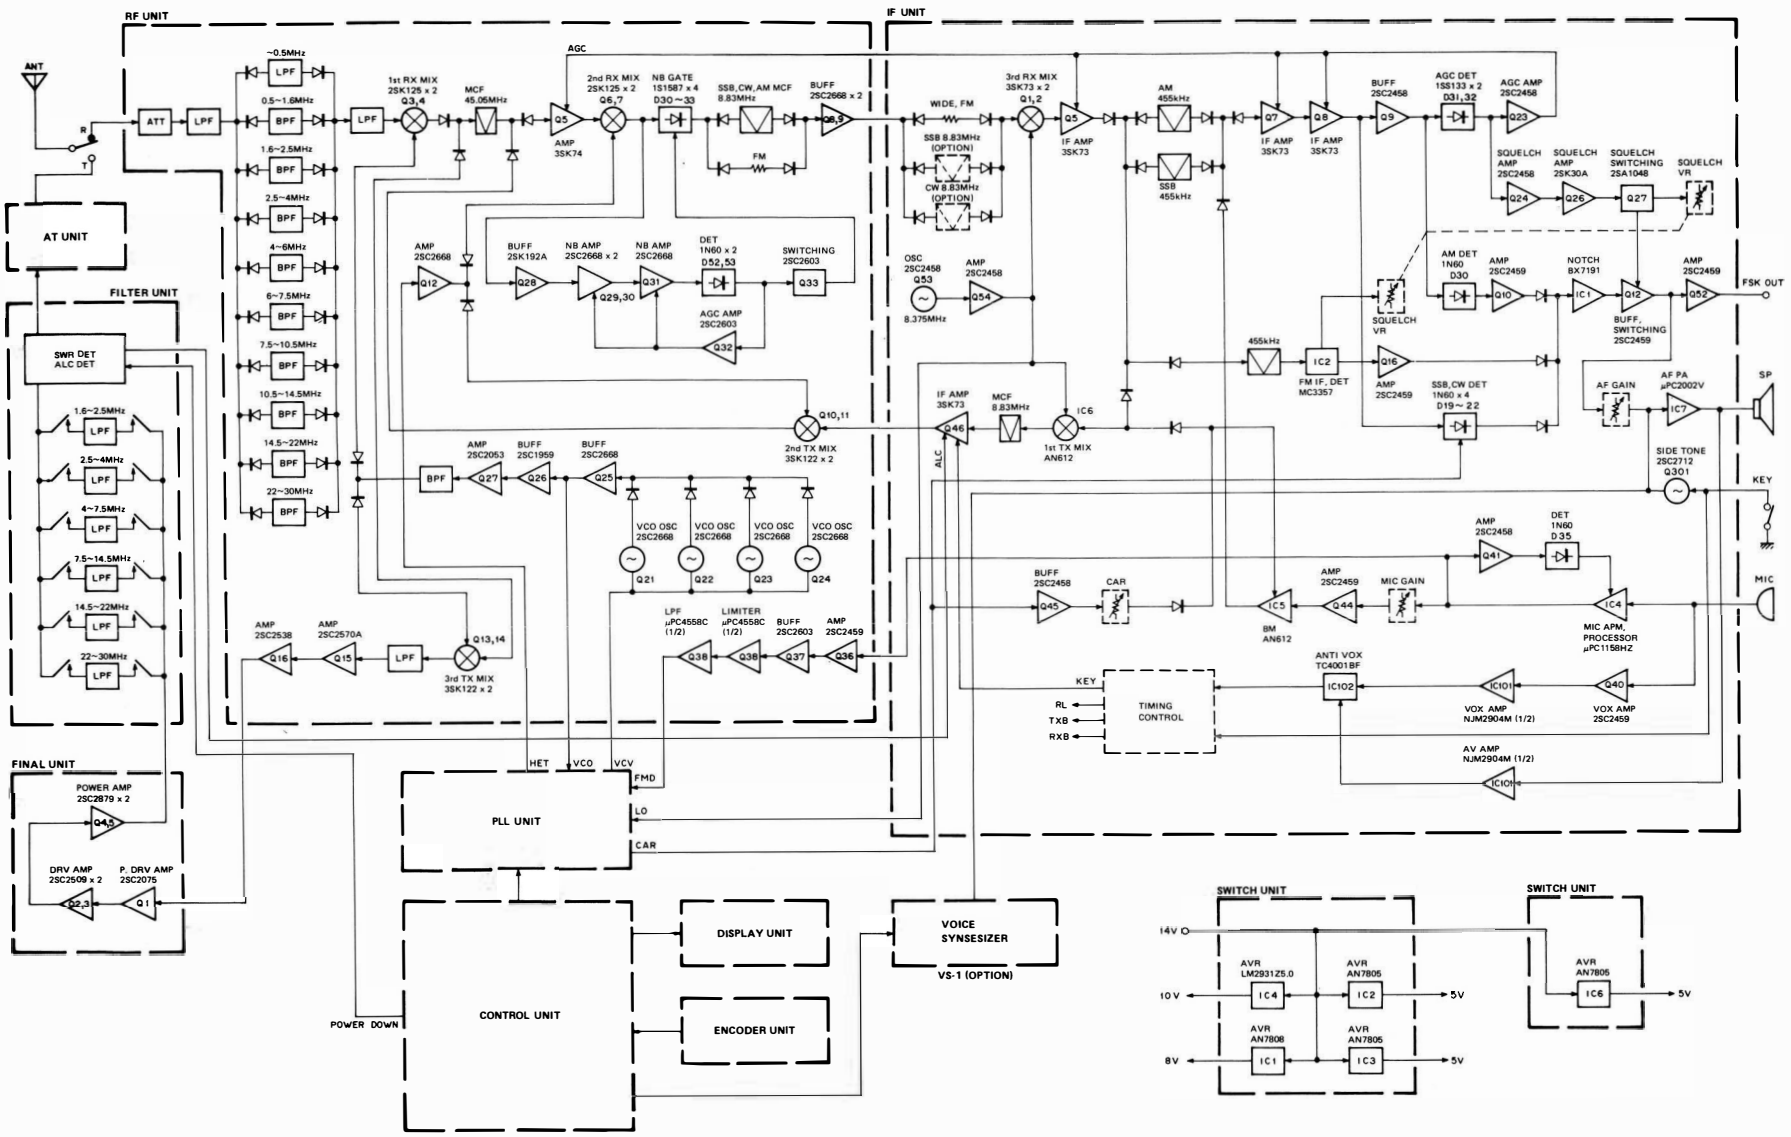
Frequency: 14.200 MHz

Note 1: The high frequency section is measured by the RF valve voltmeter in the CW mode, and the low frequency section is measured using the AF valve voltmeter in the USB mode to obtain this value.

Note 2: The value of the audio input signal is obtained by the 1 kHz single tone which measures almost full scale within the ALC zone of the meter in the USB mode or standard modulation (±3 kHz, dev.) in the FM mode.

Note 3: Set the MIC VR to its maximum level position.

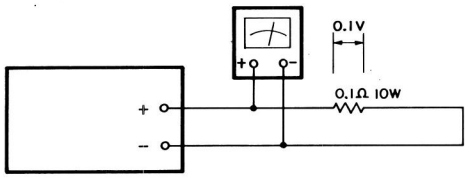
BLOCK DIAGRAM



ADJUSTMENT

1. OUTPUT VOLTAGE

1) Connect the load and set the current to 20A.
2) Adjust output voltage to 13.8 V ± 0.4 V with VR1.



2. PROTECTION CIRCUIT

1) POWER SW: OFF
2) Connect a 0.1 Ω 10 W resistor.
3) POWER SW: ON
4) Adjust VR2 so that 0.1V DC is obtained.

SPECIFICATIONS/PARTS LIST

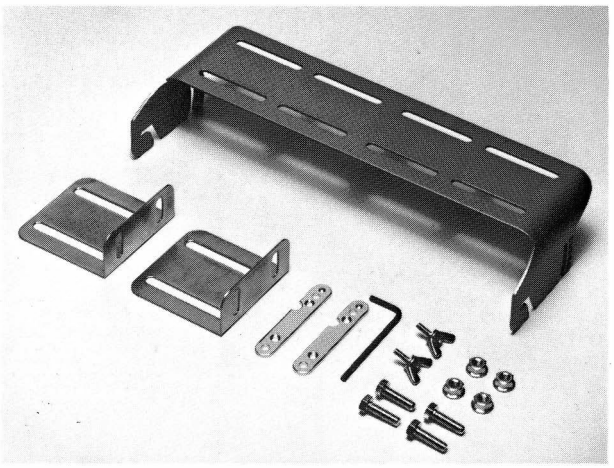
MB-430 OUTSIDE VIEW



SP-430 SPECIFICATIONS

SPEAKER SIZE	3"
RATED INPUT	1.0 watts
IMPEDANCE	8 ohms
FREQUENCY RESPONSE	300 Hz to 5 kHz
DIMENSIONS	4-7/8" wide x 3-3/4" high x 9-1/3" deep (excluding feet)
WEIGHT	3.1 lbs.

SP-430 PARTS LIST

N : New parts

Part No.	Re-marks	Description		Ref. No.
A01-0942-03	N	Case (B)		
A01-0944-03	N	Case (A)		
A20-2468-03	N	Panel	**K,M**	
A20-2469-03	N	Panel	**T**	
A23-1431-04		Rear panel		
B04-0406-04	N	SP grill		
B07-0613-14		SP ring		
B39-0407-04		Spacer x 2		
B46-0404-00		Warranty card	**K**	
B50-4026-00	N	Instruction manual	**K,M**	
B50-4027-00	N	Instruction manual	**T**

FILTER

YK-88S

Item	Rating
Nominal center frequency	8830 kHz
Center frequency deviation	Within ±150 Hz at 6 dB
Pass bandwidth	±1.2 kHz or more at 6 dB
Attenuation bandwidth	±1.5 kHz or more at 6 dB ±2.2 kHz or less at 60 dB ±3.0 kHz or less at 80 dB
Ripple	20 dB or less
Insertion loss	6 dB or less
Guaranteed attenuation	80 dB or more within ±3 kHz or 1 MHz
Input and output impedance	600 Ω//15 pF

Table 1 SSB crystal filter YK-88S (L71-0208-05) Option

YK-88SN

Item	Rating
Center frequency fo	8830 MHz
Center frequency deviation	8830 kHz ±150 Hz at 6 dB
6 dB bandwidth	±900 Hz or more
60 dB bandwidth	±1800 Hz or less
Guaranteed attenuation	80 dB or more within fo±2.5 kHz to ±1 MHz
Ripple	2 dB or less
Insertion loss	3 dB±2 dB
Input and output impedance	600 Ω/15 pF

Table 2 SSB crystal filter YK-88SN (L71-0220-05F) Option

YK-88C

Item	Rating
Center frequency fo	8830.7 kHz
Center frequency deviation	fo±150 Hz at 6 dB
6 dB bandwidth	±250 Hz or more
60 dB bandwidth	±900 Hz or less
Ripple	2 dB or less
Insertion loss	6 dB±2 dB
Guaranteed attenuation	80 dB or more within fo±2 kHz to ±1 MHz
Input and output impedance	600 Ω/15 pF

Table 3 CW crystal filter YK-88C (L71-0211-05) Option

YK-88CN

Item	Rating
Center frequency fo	8830.7 kHz
Center frequency deviation	fo±50 Hz at 6 dB
6 dB bandwidth	±125 Hz or more
60 dB bandwidth	±600 Hz or less
Ripple	2 dB or less
Insertion loss	8 dB±2 dB
Guaranteed attenuation	80 dB or more within fo ±2 kHz to ±1 MHz
Input and output impedance	600 Ω/15 pF
